Levi Strauss Has Indicated A Paradox In The Form Of An Antinomy, Which Is Similar To Lancan Paradox; Two Series Being Given One Signifying And The Other Signified, The First Presents And Excess And The Latter A Lack; By Means Of This Excess And This Lack, The Series Refer To Each Other In Eternal Equilibrium And In Perpetual Displacement.; I Interpret This As One In A State Of Disequilibrium Which Is The Manifested State Of The Universe Corresponding To Shivashaktimithunapinda, The Union Of Polarised States Of Consciousness And Power, Dynamism And Staticity, This Is The State Where All Dualities Cease; Hero Of The *Cosmos* Says The Primordial Signifier Is Of The Order Of The Language ; In Whatever The Manner Language Is Acquired ,The Elements Of Language Must Have Been Given All Together, All At Once Since They Donot Exist Independently Of Their Possible Differential Relations ; But The Signified In General Is Of The Order Of The Known, Though The Known Is Subject To The Law Of Progressive Movement Which Proceeds From One *Parte* To Another Partes Extra *Parte*; And Whatever Tantalizations Knowledge May Perform They Remain Asymptotic To The Virtual Totality Of Language; The Signifying Series Organizes A Preliminary Totality While The Signified Series Arranges The Produced Totalities (Manifested Universe: My Interpretation) Source: The Logic Of Sense: Deleuze: Eight Series Of Structure: Page 48 See Section Seventy Six For Models

The Universe Signified Long Before We Began To Know That What Is Signifying; Man Since His Origin Has Had At His Disposal A Completeness Of Signifier; He Is Obstructed From Allocating To A Signified, Given As Such Without Being Any Better Known; There Is Always An Inadequacy Between The Two Namely The Signifier And The Signified. Ferdinand De Saussure Theorizes That A "Sign" Has Two Parts: Signifier And Signified. The Signifier Is The Form That The Sign Will Take, Whether It Is A Sound Or Image And The Signified Is The Meaning That Is Conveyed; Robinson On His Desert Island Could Reconstruct An Analogue Of Society Only By Giving Himself; All The Rules And Laws Which Are Reciprocally Implicated, Even When Still Have No Objects; The Conquest Of Nature Is On The Contrary, Progressive And Partial, And Advances Step By Step(Like A General Ledger Or A Summary Sheet Or A Transfer Scroll-Mine); Any Society Whatsoever Has All Its Laws Governing Love Labour, Kinship And Marriage, Servitude And Freedom, Life And Death;. But The Conquest Of Nature, Without Which It Would Be No Longer Be Society Is Achieved Progressively, From One Source Of Energy To Another From One Object To Another; This Is The Reason Why Law Weighs With All Its Might, Even Before Its Object Is Known, And Without Ever Its Object Becoming Exactly Known Source: The Logic Of Sense: Fifth Series Of Structure: Deleuze: Page 48 See Section Seventy Seven For Models

Derrida's Notion Of A "General Text" Refers To A Highly Abstract Set Of Conditions For The Production Of "Sense" Or "Meaning" Which Any Signifying Item Must Satisfy. For Example: Any Semiotic Or Semantic Theory Must Assume A Distinction Between Sign Tokens And Ideal Types Which Each Repetition Or "Iteration" Of A Sign Instances. But, Derrida Argues, Iteration Cannot Be Reinstantiation Of An Abstract Object, For Any Significant Particular Can Always Be Detached From Its Context And "Grafted" Into A New One In Which It Means Otherwise. Thus Repetition Is Not The Repetition Of The Self-Same, But Is Constantly Divided By Differences That No Theory Can Program In Advance. In Derrida's Later Work This Undecidable Logic Assumes A Broader Ethical Significance. Iterability Implies That The Text Is Both Context-Bound And Transcends Any Given Context, Supposing "Both That There Are Only Contexts, That Nothing Exists Outside Context … But Also That The Limit Of The Frame Or The Border Of The Context Always Entails A Clause Of Nonclosure. The Outside Penetrates And Thus Determines The Inside" (Derrida 1988, 152). Any Application Of A Moral Or Legal Principle Is Thus Potentially An Act Of Reinterpretation Or Invention: "Each Case Is Other; Each Decision Is Different And Requires An Absolutely Unique Interpretation, Which No Existing, Coded Rule Can Or Ought To Guarantee Absolutely" (Derrida 2002, 251). If Iterability Is A Feature Of General Textuality (A Condition Of Thought Or Meaning As Such) It Implies An Open-Textured Temporal Structure. The Subject Of Thought, Experience And Intentionality Is, Accordingly, An "Effect" Of A Mobile Network Of Signifying States Structurally Open To Modification Or Recontextualisation. Derrida's Neologism Différance Captures This Essential Openness by Capitalizing on the Homonymy between the French Verbs for Differing and Deferring. The Identity Or

Stability Of The System Of Traces Is Differed-Deferred Because "Vitiated By The Mark Of Its Relation To The Future Element" (Derrida 1986, 13–17). Formally, These Poststructuralist Philosophies Introduce Logic Of Excision Into Their Accounts Of Generative Systems Such As Texts And Virtual Multiplicities. As A Consequence Of Its Dependence On Generative Systems The Subject Must Be Susceptible To "Becoming Other" – To Transformative Lines Of Flight – And, As Derrida's Analysis Implies, There Must Be Constitutive Limits On The Capacity Of Practical Rationality To Determine The Value Of A Particular Process Of Transformation Into The Other, Since Such Lines Of Flight Will Be Liable To Reframe Or Reinvent Any Practical Principles That We Might Bring To Bear On Them. Now, We Can See That Both Derrida And Deleuze Agree With Proponents Of Cyborg Ontology That Humans Are Not Unified Subjects But Effects Of Generative Systems That Can Be Grafted Or Iterated Onto Other Systems When Material Conditions Allow, Generating New Kinds Of Subject-Effects. This Implies One Version Of What The Deleuzean Philosopher Of Science Manuel DeLanda Calls A "Flat Ontology" In Which There Are No Superior Organizing Principles Such As Essences; In This Case, No Hierarchy Between The Transcendental Realm In Which The Modality Of Entities Is Bestowed By Their Mode Of Appearance And An "Ontic" Sphere Describable By Empirical Science (DeLanda 2009, 58; Roden 2006). A Flat Ontology Dissipates The Transcendental Subject

Underlying The Correlationist Theses Criticized By Meillassoux: Those Of Kant And Husserl, As Well As Its Ostensibly Anti-Cartesian Avatars Such As Heidegger's Dasein (Derrida 1986, 124-126). However, It Is Easy To Show That This De-Transcendentalized World Leaves In Place A Range Of Mundane, Empirical Subjects, Many Of Which Are Perfectly Conducive To The Humanist Project. To Begin With, Does It Matter For Liberal Conceptions Of Autonomy That Embodied Approaches To Cognition Relocate Many Cognitive Processes Outside The Skin-Bag To Interactions Between Bodies And Environments? Let's Suppose, Along With Hayles And Other Proponents Of Embodied Cognition, That The Skin-Bag Is An Ontologically Permeable Boundary Between Self And Non-Self (Or Exo-Self). However, Given The Principle Of Parity Between Bodily And Extra-Bodily Processes, This Need Not Make The Business Of Thinking And Deliberating Less Evaluable In Terms Of The Standards Of Rationality That Humans Currently Apply To Their Actions. Even If The Humanist Subject Emerges From The Cumulative Activities Of Biological And Non-Biological Agents, This Metaphysical Dependence (Or Supervenience) Need Not Impair Its Capacity To Subtend The Powers Of Deliberation Or Reasoning The Liberal Theory Requires Of It. What About The Effects Of The Iterability, Difference And Repetition On The Stability Of Meaning That Arguably Underlies The Exercise Of Rational Deliberation And Reasonable Discourse? Derrida's Deconstruction Of The Constitutive Power Of The Subject, Like Deleuze's Metaphysics Of Difference, Certainly Emphasizes The Way A Conceptually Irreducible Or Differential Repetition Escapes A Formalist Conception Of Thought As A Tokening Of Concepts Of Intentional Contents (See Bearn 2000 For A Refined Comparison Of Derrida's And Deleuze's Theories). I Have Argued Elsewhere That We Can Read Derrida's Arguments In A Naturalized/Secular Way Or In A Quasi-Mystical Fashion Formally

Analogous To The Structures Of Transcendence Discussed Earlier. The Mystical Interpretation Holds That The Iterable Mark Is Not Merely Indeterminate But Implies A "Trace" Of Radical Otherness That Ultimately Eludes Theoretical Articulation (Roden 2006, 81). However, This Mystical Otherness Implies A Superior Organizing Principle That It Radically Eludes, Which Is Incompatible With The Flat Ontology Outlined Here The Secular Reading Treats Derrida's Argument As A More Modest Interrogation Of The Limits Of Any Metaphysics Of Content Or Meaning Which Makes It Depend On Finite Contexts Or Systems (Roden 2006, 82). Critical Posthumanism – Drawing On Deconstruction, Postructuralism And Theories Of Embodied Cognition – Thus Complicates And Nuances The Metaphysics Of Autonomy And Personhood Characterizing Traditional Humanism. However, A Distributed Subject, "Smeared" In Both Space (Extended Cognition) And Time (Différance, The Virtual) Can Exercise Normal Capacities For Deliberative Rationality Required By Liberal Theory Just So Long As Its World Is Relatively Stable And Singular Contexts Rare Or Infrequent. Thus The Deconstructive Implications Of Cyborg Ontology Are Far Narrower Than Commonly Appreciated. The Fact That The Demise Of The Transcendental Subject Is So Routinely Confused With That Of The Liberal Subject, Say, Can Be Attributed To A Failure To Heed Derrida's Precautionary Distinction Between Transcendental And Anthropological

Humanisms (Derrida 1986, 118). Transcendental Humanisms, Such As Hegel's And Husserl's Phenomenologies, Furnish Arguments Against The Relativist Claim That Reason Or Thought Is Bounded By Particular Historical Or Cultural Constructions Of Reason; Exhibiting These As Phases In The History Of A Universal Reason That Is, At The Same Time, A "Human" Reason Stemming From The Structure Of First Person Subjectivity (Derrida 1986, 122). Deconstruction Of Transcendental Humanism (And The Consequent Rejection Of The Claim That The Limits Of Cognition Or Reason Are Co-Extensive With Invariant Forms Of Subjectivity) Is Consistent With A Cyborg Humanism That Attributes A Shared Cognitive Nature To Humans. For Example, It Is Possible That The Refined Cognitive Powers That Allow Humans To Make Promises, Think About Non-Existent Or Merely Hypothetical Entities, Enter Into Contracts, And Consider The Coherence Of Scientific Theories Depend On A Capacity To Frame Thoughts With A Compositional And Recursive Symbolic Structure. Complex Symbols Such As Sentences And Predicate Expressions Are Composed According To Grammatical Rules. Rules Governing Logical Connectives Or Embedded Clauses, For Example, Allow Symbols Of Arbitrary Complexity To Be Composed Recursively By Reapplying Them To Their Own Output (Bermudez 2002). Terrence Deacon (1997) Has Hypothesized That The Emergence Of Proto-Languages Produced Selection Pressures Favouring Good Symbolic Cognizers, Even As Limitations On Symbolic Cognition Imposed Constraints On The Form Of Culturally Transmissible Languages. Extended Mind Theorists Cite Current Research In Cognitive Psychology Suggesting That These Capacities "Co-Opt" The Public Representational Resources Of Syntactically Structured Symbol Systems (Clark 2006; Carruthers 2002). Presaging This Line Of Enquiry With A Purely Conceptual Analysis, Donald Davidson Has Argued That The Possession Of Propositionally

Structured Beliefs – Such As The Belief That Lima Is Capital Of Peru – Requires A Grasp Of What Belief Is And Thus Of The Possibility Of Being Mistaken. However, Evaluation Requires A Common Medium Or Representation In Which To Evaluate And Interpret The Beliefs Of Both Ourselves And Others. Public Language, By Virtue Of Its Compositional Structure, And Especially Its Capacity To Embed Sentences As Grammatical Complements In More Complex Sentences ("John Believes That Lima Is Capital Of Peru"), Provides This Indispensable Medium (Davidson 1984). This Shows That Cyborgianism Is Compatible With The Claim That There Are Shared Forms Of Cognition That Distinguish Humans From Non-Humans. If So, It Is Conceivable That Conditions Which Are The Technogenetic Result Of Our Cyborgian Past Could Be Fundamentally Altered By A Sufficiently Radical Cognitive Augmentation. If Propositional Thinking Is Predicated On The Use Of Linguistic Vehicles Of Content, Then The Emergence Of A Public Non-Linguistic Medium Capable Of Implementing Refined Cognitive Processes Of Some Kind Could Spell The End Of A Propositional Attitude Psychology Shared By Otherwise Disparate Human Cultures And Historical Epochs. What Is Envisaged Here Is Not Theoretical Eliminativism Of The Kind Mooted By Paul And Patricia Churchland, But The Instrumental Elimination Of Human Minds Through The Technological Erosion Of Their Cultural Preconditions. This Hypothetical Medium Might Consist Of A Complex Form Of Virtual Reality That Provides The Kind Of Capacities For Reflection And Self-Monitoring Which Extended Mind Theorists Attribute To Language In A Non-Symbolic Form. One Of The Requirements Of A Symbol System Such As A Language Is That It Is Possible To Determine Unambiguously What Symbol Type A Particular Token Symbol Belongs To (Finite Differentiation). A Continuous System Of Representations, Each Of Whose Infinitesimal Variations

Were Semantically Significant, Would Thus Fail The Finite Differentiation Test And Count As Non-Symbolic According To This Criterion. The Computer Scientist Brian MacLennan Has Argued That Such Continuous Systems – He Refers To Them, In Terms Reminiscent Of Plato, As Simulacra And Their Representations As Images – Could Have Analogues Of The Grammatical Composition And Reflectivity That We Find In Languages (MacLennan 1995, 2002). For Example, It Is Possible To Represent A Program For Transforming Any Arbitrary Image With Another Image (MacLennan 1995, 9-10). Such A Shared Cognitive Workspace Could Generate A New Class Of Hybrid Thoughts Embodied In An Immersive Virtual Reality. If This Were Done, An Entirely New Type Of Cyborgian Thinker Might Emerge Whose Thoughts Could Defy Ready Translation Into A Far More Restrictive Symbolic Medium. Such A Cognitive Hybrid Could Qualify As Posthuman Not By Failing To Instantiate A Timeless Human Nature, But By Actualizing A Line Of Flight Relatively Inaccessible To Unaugmented Humans. Whether This New Multiplicity Was Posthuman Or Transhuman Would Be Contingent Upon Whatever Possibilities Of Political And Personal Engagement It Afforded Those Who Did Not Participate In The Workspace. This Scenario Presupposes Controversial Positions In Cognitive Science, Anthropology, And The Theory Of Computation. These May Well Turn Out To Be Incorrect. However, The Philosophical Importance Of These Speculations Does Not Lie In Their Prognostic Reliability (Which Is Limited) But In Their Capacity To Displace The Sense Of "Speculation" Itself. They Are Not Speculative In The Way That Kantian Claims About The Transcendence Of The Noumenon Are. There, "Speculation" Denotes The Positing Of An Absolute That Exceeds The Limits Of Human Cognition. If Human Cognition Arises From A Fixed Cognitive Nature, The Human Subject Can Know What Transcendence Means Insofar As It Can Reflect Upon

Transcendental Conditions For Subjective Experience – E.G. Through Phenomenological Investigation. If The Extended Mind Theorists And Critical Posthumanists Are Correct, However, There Is No Invariant Cognitive Nature In This Sense And Thus No Way To Delineate The Character Of Posthuman Difference A Priori. This Shows That Even If We Accept The Core Tenets Of Critical Posthumanism, We Cannot Exclude, A Priori, The Possibility Of A Posthuman Alterity. We Can Only Preclude An A Priori Conception Of What That Possibility Entails. This Reframing Of The Speculative Character Of Speculative Posthumanism Suggests How Transhumanist Ethics Can Negotiate The Posthumanist Impasse Without The Morally Dubious Recourse Of Discounting The Possibility Of Radically Non-Human Posthumans. If The Genuinely Posthuman Would Be, Like The Human, A Historically Emergent Multiplicity, There Can Be No A Priori "Posthumanology." We Can Understand The Posthuman Only In The Process Of Its Emergence Or Line Of Flight From The Human. Thus Understanding The Posthuman Is Not Rendered Impossible By Imaginary Limitations On Human Understanding, But Nor Will It Be Achieved By Armchair Speculation On The Essential Nature Of The Human And The Posthuman. It Can Be Achieved Only Through Participating – To A Greater Or Less Degree – In The Excision Of The Posthuman From The Human. The Posthuman Is Thus The Idea Of A Speculative Transformation Of The Human That Can Be Developed Through A Range Of Synthetic Activity: Say, By Developing And Testing Enhancement Technologies, The Development Of Cybernetic Art Forms Or The Fielding Of Imaginative Possibilities In Philosophy Or Literature. In Derridean Terms, These Productive Activities Occasion Singular Judgements In Which We Re-Invent Our Understanding Of Anthropocentric Concepts. In Deleuze's, More Materialist, Terms They Are The "Untimely Becomings" In Which Posthuman Entities Acquire

Profoundly New Capacities To Act And To Be Affected, Eventuating Lines Of Flight That Might Conceivably Weaken Affiliations To Preceding Forms Of Bio-Political Organization Such As Liberalism Or Capitalism. I Distinguish The Ethics Of Transhumanism From A Related Metaphysical Position Which I Refer To As "Speculative Posthumanism." Speculative Posthumanism Holds That Posthumans Might Be Radically Non-Human And Thus Unintelligible In Human Terms. I Claim That This Transcendence Can Be Viewed As Analogous To That Of The Thing-In-Itself In Kantian And Post-Kantian European Philosophy. This Schema Implies An Impasse For Transhumanism Because, While The Radically Non-Human Or Posthuman Would Elude Evaluation According To Transhumanist Principles Such As Personal Autonomy Or Liberal Freedom, It Is Morally Unacceptable For

Transhumanists To Discount The Possible Outcomes Of Their Favoured Policies. I Then Consider Whether The Insights Of Critical Posthumanists, Who Employ A Cyborg Perspective On Human-Technology Couplings, Can Dissolve This Impasse By "Deconstructing" The Opposition Between The Human And Its Prospective Posthuman Successors. By Exhibiting Its Logical Basis In The Postructuralist Philosophies Of Derrida And Deleuze, I Show That The Cyborg Perspective Is Consistent With Both Cyborg Humanism And A Modified Speculative Posthumanism. This Modified Account Treats The Alterity Of The Posthuman As A Historically Emergent Feature Of Human And Posthuman Multiplicities That Must Be Understood Through Their Technical Or Imaginative Synthesis, Not In Relation To A Transcendental Conception Of The Human. Contemporary Transhumanists Argue That Human Nature Can And Should Be Altered Through Technological Means Where Such Enhancements Are Likely To Lead To The Majority Of Individuals Leading Better Lives. This Ethic Is Premised On Prospective Developments In Nanotechnology, Biotechnology, Information Technology, And Cognitive Science – The So-Called "NBIC" Suite. One Of The Areas Of Particular Concern For Transhumanists Is The Use Of Such Technologies To Enhance Human Cognitive Functions Such As Learning, Memory, And Attention. For Example, Such Pharmacological Agents As Modafinil Are Currently Used To Enhance Learning And Working Memory. Transcranial Magnetic Stimulation Of Areas Of Neural Tissue May, One Day, Be Routinely Employed To Increase The Neural Plasticity Associated With Learning And Memorization (Bostrom And Sandberg 2006). More Speculatively, Micro-Electric Neuroprostheses Might Interface The Brain Directly With Non-Biological Cognitive Or Robotic Systems (Kurzweil 2005, 317).1 Such Developments Could Bring The Day When All Humans Will Be More Intellectually Capable, Whether Because Of

Enhancements Of Their Native Biological Machinery Or Through Interfacing With Artificial Information Processing Systems. However, Some Transhumanists Such As Vernor Vinge, Ray Kurzweil And Hans Moravec Argue That A Convergence Of NBIC Technologies Will Not Only Enhance Human Intelligence, But Give Rise To Beings With Superhuman Intellectual Capacities. Since Designing Intelligence Is, Itself, A Feat Of Intelligence, Super-Intelligence Could Design A Still More Super Intelligence, And So On Through An Unbounded Series Of Recursive Improvements. Beyond This Threshold, There Would Be An Exponentially Fast Change In The Level And Quality Of Mentation. Vinge Refers To This Point As "The Technological Singularity," Claiming That Such A Singularity Could Occur With The Creation Of A Single Super-Intelligent Machine (Vinge 1993; Bostrom 2005, 8). Vinge Is Sensibly Agnostic About The Precipitating Causes Of Such A Singularity: The Super-Intelligence In Question Might Result From Some Targeted Biological Alteration In Human Beings, From The Use Of "Human/Computer Interfaces" Of The Kind Anticipated By Kurzweil, Or From An Emergent Property Of Large Information Systems (Vinge 1993). Since Such A Situation Is Unprecedented, The Best We Can Do To Understand The Post-Singularity Dispensation, Vinge Claims, Is To Draw Parallels With The Emergence Of An Earlier Transformative Intelligence: "And What Happens A Month Or Two (Or A Day Or Two) After That? I Have Only Analogies To Point To: The Rise Of Humankind" (Vinge 1993). If This Analogy Between The Emergence Of The Human And The Emergence Of The Posthuman Holds, We Could No More Expect To Understand A Post-Singularity Entity Than A Rat Or Non-Human Primate – Lacking The Capacity For Refined Propositional Attitudes – Could Be Expected To Understand Such Human Conceptions As Justice, Number Theory, And Public Transportation. Vinge's Position Nicely Exemplifies A Generic

Philosophy Of The Posthuman That I Will Refer To As "Speculative Posthumanism." Speculative Posthumanists Claim That Descendants Of Current Humans Could Cease To Be Human By Virtue Of A History Of Technical Alteration. The Notion Of Descent Is "Wide" Insofar As The Entities That Might Qualify Could Include Our Biological Descendants Or Beings Resulting From Purely Technological Activities (E.G., Artificial Intelligences, Synthetic Life-Forms, Or Uploaded Minds). Speculative Posthumanism Claims That An Augmentation History Of This Kind Is Metaphysically And Technically Possible. It Does Not Imply That The Posthuman Would Improve Upon The Human State Or That There Would Exist A Scale Of Values By Which The Human And Posthuman Lives Could Be Compared. If Radically Posthuman Lives Were Very Non-Human Indeed, We Could Not Assume They Would Be Prospectively Evaluable. For Example, Vinge Suggests That A Super-Intelligent Machine Might Lack Awareness Of Itself As A Persistent "Subject" Of Experience. For A Modern Tradition Exemplified In The Transcendental Philosophy Of Kant And Later Phenomenological Philosophers, This Possibility Is Problematic. For Kant, This Is Because The Subject Is Not A "Bare Locus" Of Identity But Has A Transcendental Function Of Synthesizing Or "Unifying" Sensory Information Given Under The Subjective Forms Of Space And Time Into Experiences Of A Common, Objective World. However, Kant Allowed That There Could Be Thinkers Whose Mental Life Does Not Entail The Synthesis Of Sensory Representations. In The Critique Of Pure Reason, He Speculates About Non-Sensory "Intellectual Intuition" That Produces Objects Rather Than, As In Humans, Imposing A Synthetic Unity On Their Sensory Affects (Kant 1787, B 307). A Being With Intellectual Intuition Could Have Unmediated Knowledge Of Things As They Are-In-Themselves (Noumena) Rather Than As Represented Under The Sensory Forms Of Space And Time

(Phenomena). If Kant Is Right, Then The Presence Of First-Person Subjectivity In Humans Does Not Preclude A Radically Non-Subjective Phenomenology In Non-Humans. Most Of Kant's Successors In The Idealist And Phenomenological Traditions Have Rejected Both The In-Itself And The Possibility Of Intellectual Intuition, Claiming That A Thing Is Nothing Other Than An Object For A Possible Subject. Subject And Object Would Then Be Indissociably Related (Meillassoux 2006). "Correlationism," As The Philosopher Quentin Meillassoux Christens This Position, Has Dominated Post-Kantian European Philosophy, Morphing Into A Slew Of Postmodern Idealisms. However, As Meillassoux Argues, Correlationism Has The Absurd Consequence That The Cosmic Emergence Of Subjectivity Or Language Becomes Inconceivable; For, Since Nothing Exists Outside The Correlation, It Has No History. If We Reject Correlationism, However, We Must Hold That Reality Is Not Exhausted By Any System Of Correlations: The Unconditioned Thing-In-Itself Must Be Admitted And So Must The Possibility Of Different Modes Of Access To It. Thus Even If Our Way Of Accessing The Real Requires A Subject, Others May Not. Given This Minimal Realism, Vinge's Speculations About Posthuman Non-Subjective Intelligence Are Conceptually Coherent, Irrespective Of Their Technical Possibility. It Seems, Then, That A Posthuman Reality Could Be, As Vinge (1993) Avers, "Too Different To Fit Into The Classical Frame Of Good And Evil." Our Public Ethical Frameworks Arguably Presuppose That Candidates For Our Moral Regard Have Phenomenologies Similar To Humans, If Only In The Sentient Capacities For Pain, Fear, Or Enjoyment. Moral Conceptions Such As Autonomy Or Responsibility Would Be Inapplicable To A Subjectless Posthuman. The Central Value That Modern Liberal Theory Places On Liberty And Democratic Legitimacy Would Be Likewise Unintelligible. How Should Transhumanists Respond To This Possibility? Should They

Simply Discount It, Confining Their Attention To The Evaluable Outcomes Of Transhumanist Intervention? Discounting The Posthuman Is Morally Irresponsible, Though, Given The Possible Role Of Transhumanist Intervention In Producing It. Thus Transhumanists Should Try To Evaluate The Emergence Of An Incommensurate Posthuman Alterity. However, If We Recognize Evaluation As A Non-Starter, Any Attempt To Do So Would Be Incoherent. Thus It Appears That Transhumanists Are Morally Obliged To Evaluate The Unevaluable. We Can Refer To This Impossible Demand As The "Posthuman Impasse." However, This Formulation Of A Transhumanist Aporia Invites A Critical Riposte From A Position Distinct From Speculative Posthumanism Or Transhumanism: Critical Posthumanism. Vinge's Formulation Of The Singularity Hypothesis Is, As We Have Seen, Reflexively Anti-Prognostic. We Can At Best Anticipate The Antecedent Conditions Of The Singularity, Not The Form Of A Post-Singularity Dispensation. In That Sense, The Singularity Is Formally Analogous To Kant's Thing-In-Itself. Just As A Representable Thing Could Not Be A Thing-In-Itself, So An Anticipatable Future Could Not Be A Post-Singularity Future. In Each Case, We Are Confronted By A Logically Conceivable Reality That Transcends The Principled Limits Of Human Cognition And Knowledge. However, The Claim That There Are Principled Limits To Human Cognition Is Philosophically Objectionable On A Number Of Grounds. In The Present Context, The Most Significant Of These Is That The Strong Incommensurability Claim Presupposes: A) A Fixed Set Of Cognitive Forms Proper To A Fixed Human Nature; And B) That There Is No Such Fixed Form And No Human Nature. For A Significant Cohort Of Intellectuals In The Academic Humanities – So-Called Critical Posthumanists Such As Katherine Hayles, Donna Haraway, And Cary Wolfe – The Claim That Human Thought Has A Fixed Form Is Belied By What Might Be

Termed "The Inner Logic Of Transhumanism," Which Insists On The Improvability Of Human Nature. What This Narrative Of Progress Ignores, According To Hayles, Is The Possibility That Technology Does Not Merely Express An Independently Constituted Human Nature, But Actively Forms And Is Co-Original With It: This Assumption, Known As Technogenesis, Seems To Me Compelling And Indeed Virtually Irrefutable, Applying Not Only To Contemporary Humans But To Homo Sapiens Across The Eons, Shaping The Species Biologically, Psychologically, Socially And Economically. (Hayles 2008.) Technogenesis Sits Comfortably With The View That Humans Are, In Andy Clark's Words, "Natural Born Cyborgs" – Cybernetic Organisms Whose Mental Life Promiscuously Extrudes Into Culturally Constructed Niches Such As Public Symbol-Systems, Industrial Megamachines And Computer Networks (Clark 2003). This Claim That Our Minds Are As Much In Our Tools And Environments As In Our Crania Is Expressed In A Principle Of "Parity" Between Processes In The Head And Functionally Equivalent Processes Outside Of It: Epistemic Action, We Suggest, Demands Spread Of Epistemic Credit. If, As We Confront Some Task, A Part Of The World Functions As A Process Which, Were It Done In The Head, We Would Have No Hesitation In Recognizing As Part Of The Cognitive Process, Then That Part Of The World Is (So We Claim) Part Of The Cognitive Process. Cognitive Processes Ain't (All) In The Head! (Clark And Chalmers 1998.) For Example, I Make Numerical Marks On Paper To Keep In Mind A Lengthy Calculation. The Parity Principle States That My Mental Activity Includes This Inscriptional Process In Addition To The Skilful Operation By Which I Track Each Stage Of The Computation And Determine When The Result Is Returned. For Clark, Our Minds Are As Much Constituted By The Cultural And Technological Niches We Inhabit As By The Neurocomputational Processes That Occur Beneath Our Skins. Hayles'

Seminal Study How We Became Posthuman Showed How The Possibility Of Re-Describing Humans As Cyborg Assemblages Emerges Historically With Information Theory, Cybernetics And Symbolic Theories Of Computation. These Allow Us To Conceive Mental Operations In A Wholly Substrate-Neutral Manner. Cyborgian Thinking, Hayles Writes, "Challenges The Human-Animal Difference; Explaining The Behaviour Of Thermostats And People Through Theories Of Feedback, Hierarchical Structure And Control, It Erases The Animate/Inanimate Distinction" (Hayles 1999, 84). It Implies That Mental Powers Of Deliberation, Inference, Consciousness, Etc., Are Already Distributed Between Endogenous Biological Networks, Actively-Sensing Bodies And A Range Of Increasingly Clever Artefacts (Hayles 1999, 239). Thus Speculations About Humanity Being Transcended By Disembodied Post-Mortals Or Swarms Of Super-Intelligent Droids Are Naïve Since, As The Title Of Hayles' Work Suggests, We Are Witnessing The Philosophical Dereliction Of The Humanism That Warranted These Fantasies Of Transcendence. The Posthuman, According To Hayles, Does Not Signify The "End Of The Humanity" But The End Of A Conception Of The Human As A Self-Present, Autonomous Agent That "May Have Applied, At Best, To That Fraction Of Humanity Who Had The Wealth, Power And Leisure To Conceptualize Themselves As Autonomous Beings Exercising Their Will Through Individual Agency And Choice" (1999, 286). Clark Endorses The Same Inference From Cyborgianism To The Impossibility Of Posthuman Transcendence: The Promised, Or Perhaps Threatened, Transition To A World Of Wired Humans And Semi-Intelligent Gadgets Is Just One More Move In An Ancient Game. … We Are Already Masters At Incorporating Nonbiological Stuff And Structure Deep Into Our Physical And Cognitive Routines. To Appreciate This Is To Cease To Believe In Any Posthuman Future And To Resist The Temptation To

Define Ourselves In Brutal Opposition To The Very Worlds In Which So Many Of Us Now Live, Love And Work. (2003, 142.) So Does Critical Posthumanism Blunt The Promise/Threat Of A Posthuman Alterity, Obviating The Posthumanist Impasse? I Will Argue That The Insights Of Critical Posthumanism – Cyborg Theory And Techno Genetic Anthropology – Leave Open The Possibility Of A Posthuman Alterity While Allowing Us To Displace The Terms In Which The Impasse Is Formulated In A More Ethically Productive Way. To See Why, We Need To Recognize The Profound Philosophical Debt Critical Posthumanism Owes To Post-War French Deconstruction And Anti-Humanism: A Debt Acknowledged Explicitly Or Implicitly In Its Formative Texts. For Example, Hayles Argues That "Deconstruction Is The Child Of The Information Age," Crediting Its Main Philosophical Proponent, Jacques Derrida, With The Insight That Speech Is A Cyborg Act, Never Simply Present Or Absent But Dependent On Operations And Contexts That Exceed The Consciousness Of The Speaking Subject (Hayles, 44). Likewise, Donna Haraway's Widely Cited "Cyborg Manifesto" Revels In The Cyborgs Metaphorical Power To Destabilize Binary Oppositions Between Entrenched Political Identities, Even As It Gestures Beyond The Deconstructive Obsession With The Divided Subject (Haraway 1989). However, As I Hope To Show, Derrida And Other Poststructuralists, Such As Gilles Deleuze, Have Been More Scrupulous In Elaborating The Philosophical Consequences Of Treating Subjectivity As An Effect Of Mutable Systems Or Assemblages, And They Furnish Us With A More Nuanced Account Of Human And Posthuman Conditions. The Humanism Interrogated By Francophone Anti-Humanists Such As Louis Althusser, Derrida, Foucault, Jean-François Lyotard, And Deleuze Envisages The Human Subject As A Source Of Meaning And Value And As The Basis For Historical Explanation. Its Invariant Nature Legitimates Progress Through The

Scientific Control Of Nature And The Construction Of Institutions That Fully Realize Its Moral Powers (Soper 1986). In Deconstruction And Poststructuralism, Humanist Narratives Of Progressive Self-Understanding And Mastery Are Challenged By Ontologies Which, Like Cyborg Theory, Resist Any Description Of The Human Subject As A Self-Present Source Of Meaning Or Self-Authenticating Source Of Value. Instead, These New Ontologies Characterize The Human As An Effect Of "Generative Systems" Whose Character Is Complex, Changeable And Inaccessible To Conscious Reflection. Two Philosophically Current Examples Of Such Systems Are Derrida's General Textuality And The Deleuzean Ontology Of The Virtual. Analogously, As Paul Patton Observes Of The Work Of Derrida's Philosophical Coevals Foucault And Deleuze: "A Distinction Is Drawn Between Present Reality, Which Can Be Understood As A Product Of History, And 'What We Are In The Process Of Becoming That Is To Say, The Other, Our Becoming-Other' Which Can Only Be Understood In Relation To The Virtual, The Untimely Or, In Foucault's Case, The Actual" (Patton 2007, 47). According To The Secular Reading, Derrida's Insight That Language And Thought (Insofar As The Latter Is Textual) Is Always "Cut Off. …From Its 'Original Meaning' And From Its Belonging To A Saturable And Constraining Context" Implies A Materialism For Which The Production Of Sense Is A Transformative Event Within A Complex System Sensitive To Variations That No Formal Theory Can Wholly Capture (Derrida 1988, 12; Roden 2006, 84). However, This Reading Is Consistent With The Relative Invariance Of Interpretation Over Contexts Whose Intrinsic Variability Is Small And Requires Us To Differentiate These "Mundane" Contexts From Singular Contexts – Including Singularities - Whose Novelty Calls For The Inventive Iteration Of Principles Or Categories. The Subject Without Subjectivity, This "Living Dead," Is Also Timeless – When We

Reach This Point, "Time Has Turned Into Space And There Will Be No More Time Till I Get Out Of Here" (Note How Beckett Repeats Here Wagner's Precise Formula Of The Sacred Space Of The Grail's Castle From Parsifal "Time Become Here Space," Which Claude Lévi-Strauss Quotes As The Most Succinct Definition Of Myth). The Subject We Thus Reach, A Subject Without Subjectivity, Is A Subject Which "Cannot Maintain With Any Certainty That The Experiences He Describes Are In Fact His Own; We Have A Narrating Subject Who Cannot Discern If His Voice Is His Own; We Have A Subject Who Cannot Tell If He Has A Body; And Most Crucially, We Have A Subject Who Has No Sense Of Personal History, No Memory. We Have, In Short, A Subject Whose Ontology Denies The Viability Of Mourning And Trauma, Yet Who Seems To Display The Viability Of Mourning And Trauma."(337)\ Deconstruction And Excision In Philosophical Post Humanism David Roden Journal Of Evolution And Technology - Vol. 21 Issue 1 – June 2010 - Pgs 27 – 36 Http://Jetpress.Org/V21/Roden.Html Is This Subject Deprived (E) Of All Substantial Content Not The Subject As Such, At Its Most Radical, The Cartesian Cogito? Boulter's Idea Is That, For Freud, Trauma Presupposes A Subject To Whom It Happens Accord-Coetaneousness, Coevality-Coincidence, Concurrence-Conformity, Conjunction-Contemporaneousness, Harmony, Order, Peace, Simultaneousness-Synchronicity And Who Then Tries To Narrativize It, To Come To Terms With It, In The Process Of Mourning. In The Case Of The Beckettian Narrator, On The Contrary, "There Is No Hope Of Establishing A Link Between Amity-Approving, Arbitration-Arrangement, Assenting, Authorizing, Bargaining-Compatibility, Compliance--Compromise, Concert-Concession, Conformity-Congruity, Consistency-Correspondence, Endorsing, Granting-Harmony His Own Present Condition And The Trauma That Is Its Precondition. Instead Of

Having A Story Seemingly Given To Him Unawares – As In The Case Of The Victim Of Trauma Who Cannot Recognize His Past As His Own – The Beckettian Narrator Can Only Hope (Without Hope /…/) For A Story That Will Reconnect His Present Atemporal /…/ Condition To His Past."(341) ;This Is The Division Of The Subject At Its Most Radical: The Subject Is Reduced (Eb) To $ (The Barred Subject), Even Its Innermost Self-Experience Is Taken From It. ; This Is How One Should Understand Lacan's Claim That The Subject Is Always "Decentered" – His Point Is Not That My Subjective Experience Is Regulated By Objective Unconscious Mechanisms That Are Decentered With Regard To My Self-Experience And, As Such, Beyond My Control (A Point Asserted By Every Materialist), But, Rather, Something Much More Unsettling: I Am Deprived Of Even My Most Intimate Subjective Experience, The Way Things "Really Seem To Me," That Of The Fundamental Fantasy That Constitutes And Guarantees The Core Of My Being, Since I Can Never Consciously Experience It And Assume It. ;One Should Counter Boulter's Question "To What Extent Do Trauma And Mourning Require A Subject?"(337) With A More Radical One: To What Extent Does (The Very Emergence Of) A Subject Require Trauma And Mourning? The Primordial Trauma, The Trauma Constitutive Of The Subject, Is The Very Gap That Bars The Subject From ITS OWN "Inner Life." Beckett With Lacan Part1 Slavoj Zizek See Section 90 To 100 For Models

Acknowledgements: I have made concerted efforts, sustained and protracted endeavours for the inclusion of every one and every source either in references or cross references. In the eventuality of any act of omission and commission, I make a sincere entreat, earnest beseech and fervent appeal to kindly pardon me. By nature, the work called for browsing and collating and coordinating thousands of various documents. Please excuse me in case of any prevarication from rules, or miss. Classification of the protagonist or antagonist laws is based on the characterstics and pen chance, predilection, proclivity and propensities of the systems under investigation. We acknowledge in unmistakable and unambiguous terms the help of Stanford encyclopedia, Kants writings, and Deleuze's Logic Of Sense, Penrose and Hawking's nature of space and time, Penrose's Emperor's New Mind, Shadows of mind, Ken Wilber's spectrum of consciousness etc., great men seem to be endless….google search and Wikipedia. Concerted and orchestrated efforts are made to put on recordial evidence the names of all people either under references list or mostly by cross references so that no one is missed. If there be any act of omission or commission, it is my sincere entreat, earnest beseech, fervent appeal to kindly pardon me and the error is absolutely inadvertent and in deliberate. Let not any sensibilities, susceptibilities, and sentimentalities be hurt. I want to put on record with humble gratefulness the help by American Physical society, nature and other Noetic institutes of US who sent lot of alerts for my reference which was very valuable, and could not have been found by me despite assiduous and fervent search. Most important type is that concerning the stability of solutions near to a point of equilibrium. This may be discussed by the theory of Lyapunov. In simple terms, if all solutions of the dynamical system that start out near an equilibrium point x_e stay near x_e forever, then x_e is Lyapunov stable. More strongly, if x_e is Lyapunov stable and all solutions that start out near x_e converge to x_e, then x_e is asymptotically stable. The notion of exponential stability guarantees a minimal rate of decay, i.e., an estimate of how quickly the solutions converge. The idea of Lyapunov stability can be extended to infinite-dimensional manifolds, where it is known as structural stability, which concerns the behavior of different but "nearby" solutions to differential equations. Input-to-state stability (ISS) applies Lyapunov notions to systems with inputs. von Neumann stability is necessary and sufficient for stability in the sense of Lax–Richtmyer (as used in the Lax equivalence theorem): The PDE and the finite difference scheme models are linear; the PDE is constant-coefficient with periodic boundary conditions and have only two independent variables; and the scheme uses no more than two time levels (See Wikipedia) Von Neumann stability is necessary in a much wider variety of cases. It is often used in place of a more detailed stability analysis to provide a good guess at the restrictions (if any) on the step sizes used in the scheme because of its relative simplicity. Albeit forwarded in nine module systematizations, the entire gamut is to be seen in a single shot, and the presentation of nine schedule twenty seven storey models is to circumvent typing of hundreds of superscripts and subscripts. In fact the statement is made inclusive of all previous models, and the variables are definitely different for each schedule, which again is reinstated due to typing of corresponding variables millions of systems, a fastidious and fussy work again. I beg pardon for any inconvenience caused to the readers due to such utilization of convention. **I also acknowledge help of my dear friend Professor Gnanendra Prabhu for his versatile interests in topology, differential topology, complex analysis and philosophy.**

Note: Here we talk of the characterstics of systems which satisfy the condition of cosmological constant. Notion of Understood as a unitary phenomenon (as opposed to a contingent, additive, tripartite combination of Being, in-ness, and the world), Being-in-the-world is an essential **characteristic of** Dasein .Being-in-the-world **provides us** with a reinterpretation of the activity of existing (Dreyfus 1990, 40), where existence is given the narrow reading (existence) identified earlier,. There are systems that satisfy this condition by Heidegger and we take in to consideration the characterstics of the system based on which the stratificational stratagem is formatted. There are lots of zeroes corresponding and concomitant to the second law of black holes. Infact as many as that of extant and existential blackholes exist. At the outset, it is to be stated that there are hadrons in every system. Supersymmetry between forces and matter, with both open and closed strings; no tachyon; group symmetry is SO (32) and its axiomatic predications, predicational anteriorities, character constitution shall be extant and existential in very many systems, and the characterstics are taken in to consideration in the classification scheme. Many systems have such fundamental instabilities like that of quantum gravity and characterstics of those systems form the citadel and fulcrum, bulwark and manor, mainstay and reinforcement, alcazar and chateau theory has a fundamental instability on which the classification schémas are valid. There are lots of systems which follow the axioms of string theory It is the characterstics of this system which are taken in to consideration in the classification scheme. There are various systems that have the same bastion, support system, stylobate and sentinel as that of the Deleuzean terms and predications and phenomenological methodologies systemized. Each and every system has electrons, neutrons and protons and for that matter quarks. There shall be strong nuclear force and weak nuclear force. There are many systems that satisfy the criterion specified by the equation, principle or statement in question. Characterstics of the investigating systems form the bastion for the classification scheme and doxa thereof. Systemic differentiation is conducted. Despite gravity being constant, there exists gravity between two objects, and this could be taken as a system. Depending upon some parametric representationalities, functionalities, advantageousness, appropriateness, benefit, facilitation, fittingness, helpfulness, instrumentality, merit, practicality, serviceability, suitability, and usefulness, utility, these systems could be classified in to various categories. In respect of an equation, there shall be many systems that satisfy the given equation. Equations themselves could be by the utilization of the model solved term by term as has been exemplified and illustrated many time in the previous papers. There is lot of systems that could be brought in to the orbit of and gamut of the theory in question which the investigatable systems satisfy the axiomatic predications and postulation alcovishness of the systems in question. Towards the end of classificational consummation, consolidation, corporation and concatenation we take the characterstics of the systems, the predicational interiorities, ontological consonance and primordial exactitude, accolytish representations, functional topology, apocryphal aneurism and atrophied asseveration, event at contracted points, and other parameters as the bastion and stylobate of the stratification purposes. Such totalistic entities would have easy paradigm of relational content, differentiated system of expressly oriented actions with primary focus and locus of homologues receptiveness and differentially instrumental activity, variable universalism and particularism, imperative compatibilities and structural variabilities, interactional dynamical orientation, institutionalization and internalisation of pattern variables common attitudinal orientation of constituionalisation of internalized dispositions, and a qualitative gradient of structural differentiation and ascribed particularistic solidarity abstraction or interactional dynamics, internal differentiation, structural morphology, formal characterization, concept formulation, phenomenological methodologies, constituent structure, transformational minimal condition, paradigmatic feasibilities, programmatic plausibilities, comparative variability, normative aspect of expectational prediction, projection and prognostication as consideration of the investigatory systems. Any scale can be used that is convenient to the classification scheme. It is important to note that the scheme of classification and the stratification doxa must not be adversely antagonistic, inexorably irreconcilable, antithetically antipodal, diametrically opposed, repugnantly retrogressive, inimically inverse, violatively unsimilar, diversely dissimilar, antipathetically anti thetical, conflictingly combative, obstructively pugnacious, inimically obstructive, repellently restrictive, disputatiously gainsaying or conformingly pugnacious to the axiomatic predications and postulation alcovishness of the theory in question or the equation representative or constitutive thereof. Sole intention, main objective and primary aim is twofold. One is towards the end of circumvention of the extra equation and the concomitant and corresponding variable therein. Second is avoidance of clustered congest, swarmed huddle, mustered pack, sardine

squash, and swamp throng in the scheme of classification. Only thing that is sought out is the consonance in the entire diaspora and body fabric of the systems under study. This statement is true and holds unmistakably true for all the papers and I sincerely entreat readers to remember the statement and read the paper against this background. When we write A+B we mean by that B is being added to A or vice versa. It is like adding milk to water and water to milk. There may or may not be a time gap. As said earlier there may be many systems that satisfy the conditions of the equations and those systems that are investigatory or investigatable are taken in to consideration based on their characterstics in the classification doxa. When there are more than two entities, we can take logarithm and find the value of that factor to be taken with anti log to obtain prediction and projected values of the model. In case of A-B, we are removing B from A and that means B is eating up A. These factors are taken in to consideration in the application of the model to equations. Log (ab) and Log (a+b) is well defined. Model stands out as universal testament and template for application to each sentence and equation what with the quantification process done and the correlations well defined. In the eventuality of non existence of any connection at some phase, the model would have the accentuation and attrition coefficients and detritions coefficients as zero rendering the equations of concatenation simpler. Projection formula which incorporates in its diaspora the initial values provide autheticative determination, unimpeachable validation, incontrovertible establishment , apodictic evidence, reliable roll out, unfailing cinquecento quattrocento trecento, incontrovertible indication of the final finale, notwithstanding appellation, appellative, brand, cognomen, compellation, designation, flag, handle, identification, label, moniker, nomen, slot, style, surname, tab, tag, term, title designation, appellation, appellative, class, classification, denomination, description, epithet, of the classification scepter, scenario, scimitar, schottische. There is pure and impure consciousness in every one. Gratification producing and deprivation producing one's can be easily classified from individual general ledgers. Similar analogy holds for collective general ledger and cosmic general ledger or nature's general ledger. It is also to be noted that while dealing with equations towards the end of consummation of the measure, it is necessary that the two variables are to be classified in to three sections and each one would have the adventitious and decidedly stated relationship whereby the fundamental equations are drawn up and the analysis made. All the parametric representationalities, conditionalities, orientationalities remain unequivocal as stated in the variables stated in to consideration section and are different from module to module. In essence the paper is to be read as holistic one with the sole intention, primary objective and raison d' etre to build a TOE. Towards the end of circumvention of typing hundreds of superscripts and subscripts which would be a sardine squash and the concomitant operational difficulties, model is presented in piece meal of nine modules. Logarithms are to be taken in respect of those which incorporate more than one variable in bra-ket. Values of log (ab) and log (a+b) are readily available. Anti logarithm shall be taken at the end to predict, project, prognosticate the value of the variable. This is true for tensors, vectors and other variables too. Affirmational assertion, and explanation justification, statement of vindication, annotational commentary, and explicational glossary for each and every system changes and physical interpretation of results is one thing that is to be with earnest endeavour and feverish and febrile expediency. Editions never ever mean the same and identicality of parameters and this has been explicitly and unmistakably stated in the model apriori itself. Akin and analogous, cognate and concurrent, correspondent and congruent, comparable and complementary, synonymous and duple, tantamount and agnate, commensurate and correlative representation is only to highlight the importance and subterfuge the replication of work. It is my fervent solicitation to kindly bear with me for any lapses, notwithstanding the orchestrated efforts for a paper without any minor errors. Postulation predication, conclusive presumption, differential presuppositions, underscored decidedly axiomatic statement of the statement, equation form the bye word or the watch word in the aggrandizement-amplification, caricature and crock, understatement- unembellishment, elocution-emphasis, enunciation-inflection, announcement-argument, articulation, assertion, asseveration, choice of words, commentary and communication, declaration and definition, delivery-diction, elucidation-emphasis, enunciation-execution, explanation, exposition-formulation, idiom, interpretation and intonation tone and tenor of stratification. Now, how do find the reaction of systems to these singularities. You do the same thing a boss does for you. "Problematize" the events and see how you behave. I will resort to "pressure tactics". "intimidation of deriding report", or "cut in the increment" to make you undergo trials, travails and tribulations. I am happy to see if you improve your work; but may or may not be sad if you succumb to it and hang yourself! We do the same thing with systems. systems show conducive response, felicitous

reciprocation or behave erratically with inner roil, eponymous radicality without and with blitzy conviction say like a solipsist nature of bellicose and blustering particles, or for that matter coruscation, trepidiational motion in fluid flows, or seemingly perfidious incendiaries in gormandizing fellow elementary particles, abnormal ebullitions, surcharges calumniations and unwarranted(you think so but the system idoes not!) unrighteous fulminations. So the point that is made here is "like we problematize the "events" to understand the human behaviour we have to "problematize" the events of systems to understand their behaviour. This statement is made in connection to the fact that there shall be creation or destruction of particles or complete obliteration of the system (blackhole evaporation) or obfuscation of results. Some systems are like "inside traders" they will not put signature atoll! How do you find they did it! Anyway, there are possibilities of a CAI finding out as they recently did! So we can do the same thing witn systems to. This is accentuation, corroboration, fortification, .fomentatory note to explain the various coefficients we have used in the model as also the dissipations called door. In the bank example we have clarified that various systems are individually conservative, and their conservativeness extends holisticallytoo.that one law is universal does not mean there is complete adjudication of nonexistence of totality or global or holistic figure. Total always exists and "individual" systems always exists, if we donot bring Kant in to picture! For the time being let us not! Equations would become more ensorcelled and frenzied..... philosophy merges with ontology; ontology merges with univocity of being; analogy has always a theological vision; not a philosophical vision; one becomes adapted to the forms of god; self and world; the univocity of being does not mean that there is one and the same being; on the contrary, beings are multiple and different they are always produced by disjunctive synthesis; and they themselves are disintegrated and disjoint and divergent; membra disjuncta.the univocity of being signifies that that being is a voice that is said and it is said in one and the same "consciousness". Everything about which consciousness is spoken about being is the same for everything for which it is said like gravity; it occurs therefore as an unique event for everything; for everything for which it happens; eventum tantum; it is the ultimate form for all of the forms; and all these forms are disjointed; it brings about resonance and ramification of its disjunction; the univocity of being merges with the positive use of the disjunctive synthesis, and this is the highest affirmation of its univocity like gravity; it is the eternal resurrection or a return itself, the affirmation of all chance in a single moment, the unique cast for all throws; a simple rejoinder for Einstein's god does not play dice; one being, one consciousness, for all forms and all times. a single instance for all that exists, a single phantom for all the living; a single voice for very hum of voices; or a single silence for all the silences; a single vacuum for all the vacuums; consciousness should not be said without occurring; if consciousness is one unique event in which all the events communicate with each other; univocity refers both to what occurs to what it is said. This is attributable to all states of bodies and states of affairs and the expressible of every proposition. So univocity of consciousness means the identity of the noematic attribute and that which is expressed linguistically and sense fully. Univocity means that it does not allow consciousness to be subsisting in a quasi state and but expresses in all pervading reality; CONSCIOUSNESS AND ITS UNIQUENESS June 12, 2012 at 8:40pm (See Deleuze Logic of sense, Wikipedia and Stanford encyclopedia for more details) Atrocious contrivance and device, gratificational primogeniture, calamitous dodge and expedient, depraved, destructive, disastrous, execrable gambit and gimmick, great solace and succor, iniquitous, injurious, loathsome, low, maleficent, malevolent machination and maneuver, promethaleon of candor, frankness, honesty, honor, ingenuousness, innocence, openness, reality, sincerity, truthfulness, spiteful, stinking, ugly, unpleasant, unpropitious play and ploy, progenitor of jurisprudence and circumspection, racket and ruse, savvy, scam, stratagem, subterfuge, tactic and wile, forthrightness, honesty, truthfulness embodied and personified is the structural predisposition and dispensation of the complex. Nobody need have to take the Brahman-Anti Brahman agency to be a recalcitrant, repugnant, and refractory proposition. God gives and also takes away. That is the point made. And of course lesser gods, and God doth follow them and they follow God. That is why they are lesser gods. And wield the power on lesser mortals like us. When we mean gratification and deprivation we mean celestial Brahman Anti Brahman and Terrestial Brahman and Anti Brahman agencies producing such happiness or sadness by any means such as (blending- amalgamation, adulterant-adulteration, amalgam-amalgamation, blend- combination, composite- compound, debasement-denaturant, fusion-hybrid, intermixture-reduction, amalgam- mixture, composite- compound, fusion-mishmash, aggregate- alloy, amalgamation-blend, commixture-composite, composition-compost, conglomerate-fusion, goulash-medley, mishmash-stew, blend-

All these are recorded in Nature's general ledger. Neuron DNA encapsulates all the actions passions, actions, interactions, transactions or the lack of it at various levels of individual, collective and cosmic levels. In celestial Brahman Anti Brahman ledger there is cessation of dualities. One more point to be made is if 5=3+2, then we can say 5 gormandizes 3 or 5 gobbles up 2. Quintessentially such a statement arises out of the difference of LHS and RHS term wise. It must be remembered despite all theoretical abstractions and generalizations be it proton mass or Higgs Boson, or topology of a space, it is notwithstanding the fundamentality of nature is just a number. Just everything in Physics and mathematics is just a number. Let us assume I buy rice in Bangalore (District) worth 5k.g. I can always divide 5k.g.s of rice in categories of Bangalore (South), Bangalore (west), Bangalore (East) and Bangalore (South). On similar basis, there are billions of neutrons, protons and concomitant interactions which would satisfy the given numerical value. Example of gravity above makes things clear. Everything atleast is a function of time and someplace or some other coordinates, subordinates or superordinates. Mass of proton is 2.47 does not mean total mass of all protons is 2.47. It is this argument that is used in the classification scheme. By the very nature, self the unmonitoring but the witness consciousness agency identifies itself with something, be it a profession, an actor on the screen, when it does not have a identity. Such examples are legion, a Charlie Chaplin in "The Kid" or Raj kapoor in "Jagte Raho". These are people who just wanted to live and living without being put under surveillance every moment is the greatest part of their life. This is "Absolute Subjectivity" of Shiva. Such a state is always craving for identification for in pure consciousness all identities are lost. It is this "identitylessness" or having very minimal identity is what pervades most in India and this is due to expansion of individual consciousness. When that happens, be it education, or wealth, the "identity' becomes so well entrenched, they become the exact opposite of "pure consciousness"," impure consciousness" (Shakti). This is a state of "Absolute or relativistic objectivity". There was this case of a lady who went to such an extent of planning, she was sure that whatever she does must work out. When it did not, she lapsed in to "identity crisis". Such thing as this might happen in well developed countries where the competition is extremal and to be achieved at any cost. Realisation that one is not the doer but the witness consciousness is just like watching a movie in which one has acted. It is in this sense "advaita", "non duality' seems to be of cardinal and preeminent importance for the analytical treat ment of "identity' and "identity lessness", both happen in space time. "Multiverses" in this sense is also like a different film of an actor released at different theaters and it is in this sense we state that that every object in space time is a multiverse. You must have totally immersed in doing a "string theory" problem or watching a "film", oblivious of surroundings. Essentially creation (space time) also is what is happening in mind and honed in to you billion times. Identification of anything with a designation or signification is one that leads to association within spacetime, which would only have pathological consequences and detrimental ramification as stated above or positive implications of "happiness" because of the identity itself. Search or 'show" has to go on! It gives a sense of consummation. Like the discussion of psephologists now doing about electoral results in India!

Introduction:

Dairy Notes: 13th Friday August 2012:

News papers publish whatever I think!

Heh! Heh!

They also write cosmological reports even before I send it to IISTE!

Hayyoh!

Every time I go out, there would get start a bevy of cars snazzy and snappy!

It is great!

I will get all of them!

You would not get a driver's post even!

Why!

You have not lost your "self"(non monitoring witness consciousness: see earlier models)

"They" have scared the owners to get started as soon as you did!

Why so?

Because you are an idiot of nth order!

Who are "they"?

"They" are people, who fight wars, insurgencies, insurrections, intransigence, and belligerence of people, they celebrate, they die in battles to reach heaven like Horatio, or live to rule! They' are veritable gods

Brahman-Anti Brahman (Terrestial) agency?

Yes!

"They" can create disequilibrium in the rajas and Tamas and manifest slides from unconscious in dreams!

Silly fellow!

No! Believe me! There is an identity crisis! And these are ones who doctoring it!

MELANINS can be extracted from hair by dilute caustic soda solution and purified by chromatography on calcium and magnesium carbonates1, 2. The extraction with 0.05 N caustic soda is easier with rabbit hair and sheep wool than with human head hair. Owing to this ease of extraction, which is important in order to obtain pure melanins, but also because we had in mind an analysis of the phenogenesis of melanic pigmentation3,4, we have studied chiefly melanins from rabbits of known genotypic constitution. Nevertheless, the similarity of the data for mammalian hair melanins generally with those for rabbit hair melanins suggests that our conclusions are applicable to hair melanins in general and to melanins of other tissues. **Letters to Editor Nature 157, 771-771 (08 June 1946) | doi: 10.1038/157771a0 Constitution of Hair Melanins J. Where do you go I say?

I will not go anywhere!

It is international Brahman-AntiBrahman agency that will take care of you!

People have short memories and nobody cares about page 3 news like you did not until it happened to you!

"They" will bring you down on your knees!

I am already on my knees!

Oh! Lord! You are playing a dangerous game!

What did I do?

Oh! I cannot father! I cannot means I cannot!

Husserlian flux **refers to** structurality that is always already implied by the consciousness of successivity. This temporalizing interplay of internationalities originally **permits** consciousness of unity and difference as the condition of any possible impression – whose 'lived' content is already the product of sedimented contents that have been retained and which are motivated by a consciousness that is always already surpassing itself in the bodying forth of that which is anticipated by means of such retention. Retention gives the passing over of the present into that which is no longer (pastness), while protention **fills** the present with the anticipation of that which is not yet (the pre-expectational horizon of open futurity). There is also a second intentionality (Längsintentionalität) longitudinal intentionality of retention, which **gives the flow itself** (where pastness is always already a constant background to the flux). Therefore, what is given is a continuum. Husserl's lecture course on the phenomenology of time-consciousness is, in large part, an extremely effective response to Hume's problem regarding the issue of continuity. It opens a deeper dimension to the study of time, which is no longer **restricted** to the aporetic limits of prefer J. S. Churchill's translation of this term: " Längsintentionalität = longitudinal intentionality "rather than J. B. Brough's "horizontal intentionality" because it does not restrict itself to the two-dimensional limits of Husserl's 'diagram' of time-constituting consciousness – where the flow of consciousness in its givenness to itself is represented as a horizontal line . Querintentionalität =transverse intentionality," is that which cuts through this line. With respect to the phenomena themselves, given the context of Husserl's discourse on "The Double Intentionality of Retention and the Constitution of the Flow of Consciousness" (sec. 39, p.84), this particular assignment of horizontal and vertical axes to the two internationalities of retention **are a**rbitrary in their designation. One must not confuse the map **with the** phenomena. There are independent reasons for demonstrating that Längsintentionalität **expresses more** of the vertical than Querintentionalität; e.g., since the latter is directed towards the immanent temporal object, while the former actually gives its extendedness within the flow – retention ally sedimented chains of continuity – its duration as depth It should be noted that Husserl is explicit about the "metaphorical "aspects of his use of the expression "flow" earlier in section 36 (see the quotation in endnote 9, below). It is mere habit of thought **to (e) restrict** the sense of "flow" to a horizontal plane. This problem is exacerbated in German because the word for horizon – a field whose extendedness combines distance and depth / thehorizontal and the vertical – is "Horizont." Hume's investigations. However, this presents a whole new set of puzzles, since the absolute or Primordial Flux / horizon (or Ur-region) of the lectures on immanent time consciousness **is (=)** field of investigation for which, as Husserl says "…we lack names." **General Introduction to Pure Phenomenology Trans. Recordial evidence says that!

Are you talking of this world?

The idea of a multiverse -- an ensemble of universes or universe domains -- has received increasing attention in cosmology, both as the outcome of the originating process that generated our own universe, and as an explanation for why our universe appears to be fine-tuned for life and consciousness. Here authors carefully consider how multiverses should be defined, stressing the distinction between the collection of all possible universes, and ensembles of really existing universes, which are essential for an anthropic argument. We show that such realised multiverses are by no means unique, and in general require the existence of a well-defined and physically motivated distribution function on the space of all possible universes. Furthermore, a proper measure on these spaces is also

needed, so that probabilities can be calculated. They then discuss several other major physical and philosophical problems which arise in the context of ensembles of universes, including the emergence and causal effectiveness of self-consciousness, realized infinities, and fine- tuning, or the apparent need for very special initial conditions for our universe -- whether they or generalized generic primordial conditions are more fundamental. Then briefly summarise scenarios like chaotic inflation, which suggest how ensembles of universe domains may be generated, and point out that the regularities which must underlie any systematic description of truly disjoint multiverses must imply some kind of common generating mechanism. Finally, we discuss the issue of testability, which underlies the question of whether multiverse proposals are really scientific propositions. In fact every object is!

Tegmark says that a person living on a planet called Earth, with misty mountains, fertile fields and sprawling cities, in a solar system with eight other planets. The life of this person has been identical to yours in every respect until now, that is, when your decision to read on signals that your two lives are diverging.

What is this great manifest duality about idea and image? The duality is present in the goal, to bring consummation of the two sorts of images and bring it full resemblance. If copies or icons are well founded, it is because of the fact because they are endowed with very good resemblance. Idea? Idea goes from one thing to another which comprehends the relations and proportions constitutes internal resonance. So resemblance is a measure of pretensions! It is both internal and spiritual! The copy resembles something only to the degree that it resembembles the idea of that thing. . The copy truly resembles something to such an extent that it is modelled on an idea. it is the superior identity of the idea which founds the good pretensions of the copies because it bases on internal or derived resemblance. Consider now other species of images like simulacra. Pretension is one thing that brings out striving power in you to bring in similarities of characterstics it conceals dissimilarity. And that is an internal unbalance. So this happens to every one to become like the other. This is the first degree of actualization. This world belongs to you. It is filled with individual self and individual motivations..... (Reference: Deleuze)

There exists a pure difference between Brahman and Anti Brahman agencies plethora of which you find which you said are at war and friendly with each other!

Why so?

They have to have some problem always!

Lest they lose their cognizance and importance!

Aw! I did not think that way!

In consideration to traditional notions of space and time as unifying forms imposed by the subject, pure difference is non-spatio-temporal; it is an idea, what Deleuze calls "the virtual". Absorbing, alluring, appealing, arousing, attractive, beguiling-captivating, compelling- curious, enchanting-enthralling, exciting-fascinating, gripping, provocative- puzzling, riveting- stimulating, stirring, thought-provoking. (The coinage refers to Proust's definition of what is constant in both the past and the present: aboveboard, actual, artless, bona fide, candid, dead-level, dear, devout, earnest, faithful, forthright, frank, genuine, guileless, heartfelt, honest to God, like it is, meant, natural, no fooling, no-nonsense, on the level, on the line, on up and up, open, outspoken, plain, pretension less, real, regular, righteous, saintly, serious, square, sure enough, true, true-blue, trustworthy, twenty-four carat, unaffected, undesigning, undissembled, unfeigned, unpretentious, up-front, wholehearted "real without being actual, ideal

without being abstract.") While Deleuze's virtual ideas superficially resemble Plato's forms and Kant's ideas of pure reason, they are not originals or models, nor do they transcend possible experience; instead they are the conditions of actual experience, the internal difference in it. "The concept they [the conditions] form is identical to its object." A Deleuzean idea or concept of difference is therefore not a wraith-like abstraction of an experienced thing, it is a real system of differential relations that creates actual spaces, times, and sensations... Such a help for people in need help you wash away all sins perpetrated for it is with servicemen shall be able to obliterate and obfuscate sins. Remember a minister shining shoes at Delhi temple is a exemplar absorbing, affecting, alluringly amusing, arrestingly attractive, beautiful, captivatingly charismatic, compellingly curious, delightfully elegant, enchantingly engagingly engrossingly enthralling, entrancingly exceptional, exotic, fascinating, fine, graciously gripping ,impressive, intriguing, inviting, lovely, magnetic, pleasing, pleasurably prepossessing, provocatively readable, refreshing, riveting, stimulatingly stirring, striking, suspicious, thought-provoking, unusual, winning illustration.

But why make idealism a body of experience address, adjurational application, entreatial, imploration, importunity, invocational overture, petition, plea, prayer, proposal, proposition ridden question, recourse, requisition, solicitation, submissional supplication?

Transcendental empiricism, transcendental idealism, only makes sense when organized by forms of sensibility (namely, space and time) and intellectual categories (such as causality). Assuming the content of these forms and categories to be qualities of the world as it exists independently of our perceptual access, according to Kant, spawns seductive but senseless metaphysical beliefs (for example, extending the concept of causality beyond possible experience results in unverifiable speculation about a first cause).Deleuze inverts the Kantian arrangement: experience exceeds our concepts by presenting novelty, and this raw experience of difference actualizes an idea, unfettered by our prior categories, forcings to invent new ways of thinking (see below, Epistemology). address, adjure, advance, apply, ask, beg, beseech, bid, call, call upon, claim, contest, crave, demand, entreat, hit on, implore, importune, petition, plead, pray, propose, proposition, question, refer, require, resort to, solicit, strike, submit, sue, supplicate, urge transcendental empiricism and idealism.

What is the Reason, absolution-basis, exonerational exculpation, variationnal philosophy mitigation-redemption-vindication, raison d'etre, Fon ET origin, thereof?

Deleuze's unusual metaphysics entails affective, arousing, awakening, breathless, dynamic, eloquent, emotional, emotive, expressive, fecund, far-out, felt in gut, grabbed by, grippingly, heartbreaking, heartrending, impelling, impressively inspirational, inspiringly meaningful, mind-bending, mind-blowing, motivating, persuasive, poignant, propelling, provoking, quickening, rallying, rousing, sententious, significant something, stimulating, stimulative, stirring, stunning, touching, turned on by an equally atypical epistemology, or what he calls a transformation of "the image of thought". According to Deleuze, the traditional image of thought, found in philosophers such as Aristotle, Descartes, and Husserl, misconceives of thinking as a mostly unproblematic business. Truth may be hard to discover—it may require a life of pure theorizing, or rigorous computation, or systematic doubt—but thinking is able, at least in principle, to correctly grasp facts, forms, ideas, etc. It may be practically impossible to attain a God's-eye, neutral point of view, but that is the ideal to approximate: a disinterested pursuit that results in a determinate, fixed truth; an orderly extension of common sense. Deleuze rejects this view as papering over the metaphysical flux, instead claiming that genuine thinking is a violent confrontation with reality, an involuntary rupture of established categories. Truth changes what we think; it alters what we think is possible. By setting aside the assumption that thinking has a natural ability to recognize the truth, Deleuze says, we attain a "thought without image", a thought always determined by problems rather than solving them. "All this, however, presupposes codes or axioms which do not result by chance, but which do not have an intrinsic rationality either. It's just like theology: everything about it is quite rational if you accept sin, affirmation, allegation, application, assertion, birthright, call, case, counterclaim, declaration, demand, dibs, due, entreaty, interest, lien, part, petition, plea, postulation, prerogative, pretense, pretension, privilege, profession, protestation, reclamation, request, requirement, requisition, suit, title, ultimatum the Immaculate Conception, and the incarnation. Reason is always a region carved out of the

irrational—not sheltered from the irrational at all, but arrestingly captivating, consumingly engrossing, enthrallingly exciting, fascinating, interesting, intriguing, monopolizing, preoccupying, riveting, spellbinding traversed by it and only defined by a particular kind of relationship among irrational factors. Underneath all reason lies delirium, and drift." Deleuze's peculiar readings of the history of philosophy stem from this unusual epistemological perspective. To read a philosopher is no longer to aim at finding a single, correct interpretation, but is instead to present a philosopher's attempt to grapple with the problematic nature of reality. "Philosophers introduce new concepts, they explain them, act, adjuration, ban, behest, bidding, call, canon, caveat, charge, citation, commandment, decree, demand, devoir, dictate, dictation, dictum, direction, duty, edict, enactment, exaction, fiat, imperative, imposition, injunction, interdiction, law, mandate, notification, obligation, order, ordinance, precept, prescript, proclamation, prohibition, proscription, regulation, request, requirement, requisition, responsibility, rule, subpoena, summons, ultimatum, warrant, will, word, writ but they don't tell us, not completely anyway, the problems to which those concepts are a response. [...]The histories of philosophy, rather than repeating what a philosopher says, hasto say what he must have taken for granted, what he didn't say but is nonetheless present in what he did say."

I think the idea and image could have coruscation locomotion in SU (N) group!

What is that?

The special unitary group of degree n denoted SU (n), is the group of n□×□n unitary matrices with determinant 1. (In general, complex unitary matrices have complex determinants with modulus 1, but arbitrary phase.) The group operation is that of matrix multiplication. The special unitary group is a subgroup of the unitary group U(n), consisting of all n□×□n unitary matrices, which is itself a subgroup of the general linear group GL(n,□C). The SU(n) groups find wide application in the Standard Model of particle physics, especially SU(2) in the electroweak interaction and SU(3) in QCD

Flow is something we speak of in conformity with what is constituted, but **it is not** “something in objective time.” (Section sixty three)

Absolute subjectivity and has the absolute properties of something to be designated metaphorically as “flow…” (p. 79) (see section sixty three)

Like a football!

Yes! That is flow!

……

How much can I control?!

You know what you are talking about?

I think so!

Then first go to harishchandra crematorium and sleep on the belt which leads you to ultimate theory in burning furnace!

See there are atleast twenty vehicles which passed by with graffiti "Mother's blessings"

So?

That means bring your mother to bless us together!

Should they not ask your mother?

No! She is a diabolic disport! Whippersnapper whirligig, volte facial ermine, weasel, sachrochusus ray imperator, Bismuth binomial, Yiddish schmaltz, perfidious knackers, insouciant dreary dredge, doleful dismal dolt, reprehensible scherzandos, harridan's wife, virago, junosquenan delinquent, discordant ostrich set to ruin her son!

Oh! You are talking about one who said she was in kitchen and does not know anything when her son was eating his heart and dying in obscurity!

Oh! You mean that gentleman who fabricated a story to con his own son and finally said there is nothing!

Yes! The same chameleon drifting drill!

What sort of people are these!

I told you they are venomous hamadryad and ghoulish giblets!

Yes! The same sea duck scoter referred to you earlier!

Why so?

Freaks of human kind who will sell their progeny and ruin them for their fads and fancies, wisdom and whimsies!

She was the same pervious paranoid pernickety, and phrenological phrenetic frantic fanatic who did a mata hari in front of her son?

Yes! The same one!

But why did she do it?

May be she thought she must give introduction!

She is the mother of deceitful legerdemain, adjurational obdurate, reproachable obloquy, overweening outrigger Satyananda who dabbles with Pinky?

Yes! The same esophagus gullet wrenching dreg who tells others to pray God and himself resorts to nefarious activities!

He is duplicate Satyananda!

Pinky sent me photographs of a man suffering from neurofibromatosis' of the fifth cranial nerve!

It was unnerving!

But I was not!

Plot is squidgy and stodgy!

Please understand, if two vehicles had passed by that is coincidence, because forty such vehicles passed by, it is coordination!

But why onus on you!

That is the way of delegation of responsibility!

By whom?

Invisible hands! Invisible eyes!

Everyone knows! But no one says!

Moon!?

Yes! But why are they scared!

Petrified! Moon was a ghostly galleon tossed upon the cloudy seas, and the devil raises its ugly shade from the grave yard and forms an albatross around victim's neck!

Spooky action at a distance!

Exactly!

How many times they that! I tell them not to! They are becoming paranoids forgetting reality!

True indeed!

Like unless there isa witness you should not believe!

But they threaten witnesses!

Well! That is not taken in to consideration!

Hume's discourse on impressions **does not** take into account the question of how they can be stretched-out in their running-off. (See section sixty three)

Emphasis on their discreteness, atleast that is what he says!

Hume also says every consciousness was actually like this, **and then there shall not be** production of what would be called 'unity of the life' of consciousness (See section sixty three)

I am fed up!

Treatise gives us an honest declaration concerning the limits of his investigations. His problem was twofold in that he considered.....that all our distinct perceptions **are** distinct existences, and that the mind never perceives any real connexion among distinct existences. Hume claims the 'privilege' of a skeptic" without committing himself to full-blown skepticism. His philosophical writing embodies an extremely rare combination of startling intellectual brilliance, methodological rigor (without doing away with risk), and genuine humility. He skillfully employs the full armory of the techniques of empiricism and makes it dance at the very limits of exhaustion. Although Hume is an empiricist from a methodological point of view, his investigations are not in the service of empiricism. Thus, he is able to show that empiricism itself always rests on certain metaphysical presuppositions. But, what legacy remains regarding the issue of the Self? Hume's introspective analyses, which upset the basis of Cartesian certainty and the primacy of the Ego, have not done away with the Self. What 'constitutes' the Self, if it is no longer to be considered as that which always already **lies behind** each act of consciousness as its primordial and monolithic core (the rest of th cogitans)

Does this suggest a dimension of inquiry that is actually inaccessible to thought? How can we speak of continuity, motivation, memory, association, judgment, etc., **without (e)** having recourse to a continuous and monolithic 'I' – the 'I' that motivates, the 'I' that remembers, the 'I' that associates, or the 'I' that judges? **Hume and Husserl -- The Problem of the Continuity or Temporalization of Consciousness more by Louis Sandowsky Hume and Husserl – The Problem of the Continuity or Temporalization of Consciousness International Philosophical Quarterly Vol. 46, No. 1, Issue 181 (March Edition) (See section 60 for models)**

Generalizations apart, do you think people could be motivated!

It is a world of man against man, man against self, man against women…what is that Hobbes called such a state!

Mors Tua vita mia!

No! Something else!

Bellum Omnium contra omnes: war of all against all; that is the description about nature!

Aw! That is it!

But why are they fighting?

I donot know!

You said freewill gormandizes destiny and vice versa, Is there is any rethinking in the light of the latest developments?

No! It is the same freewill of mine destiny of yours! Like expansion of universe speeding up!

No change taking in to account all the parameters and their internal and internecine connections!

I donot know!

Somehow I feel there has to be one all powerful individual to take the people to task!

Parà Brahman!?

Yes! Something like Lord Vishnu in whose presence differences are forgotten and they live in amity!

You mean Âdi-S'esha and Garuda the sworn enemies!

Garuda eats serpents!

When you die, they do "Vaikuntha Samaradhane" on 13th day!

Illusion! Attraction! Allurement!

You see there is a time lag of billions of years between Brahma loka and this Universe!

Einstein said that long back with Everett accentuating Multiverses!

You mean there is no edge for space time?

I donot think so!

Why does Hawking Penrose singularity theorems (energy condition, global structure condition, strong gravity to trap region) and cosmic censorship conjecture accepted then?

Moon!

They have not seen the edge!

Sop!

They are edgy!

I feel space and time are discrete! I just cannot understand reasoning of these people!

Is time a parallelogram like Plato said?

Looks like that! Enbloc preservation and conservation of events! Bit by bit perception, past, present and future are point to it!

What shall I do?

What sort of space is it?

They say it is Hilbert space!

It is my thinking in room! Not Hilbert space!

What do you mean by saying space time is singular if you cannot embed in another?

I donot understand them really!

Hyperspace?

Stop it!

Yes!

Yes!

Subject has a transcendental function of synthesizing or "unifying" sensory information given under the subjective forms of space and time into experiences of a common, objective world **(David Roden :**section ninety two)

Non-sensory "intellectual intuition" produces objects rather than, as in humans, imposing a synthetic unity on their sensory affects (Kant 1787, B 307) **(David Roden: section** ninety two)

There is neither cause nor distinguishability in pure consciousness (shiva) or impure consciousness (dynamism: Shakti)

That is the main reason for Prakruti Kshobha, Prakruti Siddhi, and Chatra Bhanga!

This schema implies an impasse for transhumanism because (e) while the radically non-human or posthuman would elude evaluation according to transhumanist principles such as personal autonomy or liberal freedom, it is morally unacceptable for transhumanists to discount the possible outcomes of their favoured policies. **Deconstruction and Excision in Philosophical Post humanism David Roden Journal of Evolution and Technology - Vol. 21 Issue 1 – June 2010 - pgs 27 – 36 http://jetpress.org/v21/roden.html**

Contemporary transhumanists argue that human nature can and should be altered through technological means where such enhancements are likely to lead (eb) to the majority of individuals leading better lives! **Deconstruction and Excision in Philosophical Post humanism David Roden Journal of Evolution and Technology - Vol. 21 Issue 1 – June 2010 - pgs 27 – 36 http://jetpress.org/v21/roden.html**

Transcranial Magnetic Stimulation of areas of neural tissue may, one day, be routinely employed (e) to increase the neural plasticity associated with learning and memorization (Bostrom and Sandberg 2006). There are some harsh rumblings under the cross braces of minds bay!

Certain continuity of appearance – that is, a continuity that is phase of the time-constituting flow **– belongs to a** now, namely, to the now that it constitutes; and to a before, namely, as that which is constitutive (we cannot say "was") of the before.(See section sixty three)

Deconstruction is the child of the information age (see section ninety eight: David Roden: Hayles quotation)

Well! That seems to be true!

New ontologies characterize the human as an effect of "generative systems" whose character is complex, changeable and inaccessible to conscious reflection (David Roden: see section ninety nine for models)

Reconstruction?

……

It may take some time……! But Hayles states cyborgs metaphorical power to destabilize binary oppositions between entrenched political identities (see section ninety eight for models)!

That is really interesting! There shall be no walls only bridges!

Structural Properties Of Faint Milky Way

INTRODUCTION—VARIABLES USED

Nicolas F. Martin et al. 2008 ApJ 684 1075 doi: 10.1086/590336 A Comprehensive Maximum Likelihood Analysis of the Structural Properties of Faint Milky Way Satellites

(1) Authors derive the structural parameters of the recently discovered very low luminosity Milky Way satellites through (e&eb) a maximum likelihood algorithm applied to SDSS data.
(2) For each satellite, even when only a few tens of stars are available down to the SDSS flux limit, the algorithm yields (eb) robust estimates and errors for the centroid, position angle, ellipticity, exponential half-light radius and number of member stars (within the SDSS).
(3) This latter parameter is then used in conjunction with stellar population models of the satellites to derive (eb) their absolute magnitudes and stellar masses, accounting for color-magnitude diagram shot noise.
(4) Most parameters are in good agreement with previous determinations, but authors now properly account (e) for parameter covariances.
(5) However, they find that faint satellites are somewhat more elliptical than initially thought, and ascribe (e) this effect to the previous use of smoothed maps, which can be dominated by the smoothing (round) kernel.
(6) As a result, the faintest half of the Milky Way dwarf galaxies (MV $\gtrsim -7.5$) is (=) significantly (4 σ) flatter ($\langle \epsilon \rangle = 0.47 \pm 0.03$) than its brightest half (MV $\lesssim -7.5$, $\langle \epsilon \rangle = 0.32 \pm 0.02$).
(7) From our best models, authors also investigate whether the seemingly distorted shape of the satellites, often taken (eb) to be a sign of tidal distortion, can be quantified.
(8) They find that, except for tentative evidence of distortion in Canes Venatici I and Ursa Major II, these can be completely accounted for (e) by Poisson scatter in the sparsely sampled systems.
(9) Authors consider three scenarios that could explain (eb) the rather elongated shape of faint satellites: rotation supported systems, stars following the shape of more triaxial dark matter subhalos, or elongation due to tidal interaction with the Milky Way
(10) Although none of these is entirely satisfactory, the last one appears the least problematic, but obviously warrants (e) much deeper observations to track evidence of such tidal interaction.

Dean E. McLaughlin and Roeland P. van der Marel 2005 ApJS 161 304 doi: 10.1086/497429 Resolved Massive Star Clusters in the Milky Way and Its Satellites: Brightness Profiles and a Catalog of Fundamental Parameters

(1) Authors present (eb) a database of structural and dynamical properties for 153 spatially resolved star clusters in the Milky Way, the Large and Small Magellanic Clouds, and the Fornax dwarf

spheroidal.

(2) This database complements and extends others in the literature, such as those of Harris and Mackey & Gilmore. Our cluster sample comprises 50 "young massive clusters" in the LMC and SMC, and 103 old globular clusters between the four galaxies. The parameters list include central and half-light-averaged surface brightnesses and mass densities; core and effective radii; central potentials, concentration parameters, and tidal radii; predicted central velocity dispersions and escape velocities; total luminosities, masses, and binding energies; central phase-space densities; half-mass relaxation times; and "κ-space" parameters.

(3) They use publicly available population-synthesis models to compute (eb) stellar-population properties (intrinsic B - V colors, reddening, and V-band mass-to-light ratios) for the same 153 clusters plus another 63 globulars in the Milky Way.

(4) They also take velocity-dispersion measurements from the literature for a subset of 57 (mostly old) clusters to derive dynamical mass-to-light ratios for them, showing (eb) that these compare very well to the population-synthesis predictions.

(5) The combined data set is intended to serve as the basis (e) for future investigations of structural correlations and the fundamental plane of massive star clusters, including especially comparisons between the systemic properties of young and old clusters.

(6) The structural and dynamical parameters are derived from (e) fitting three different models—the modified isothermal sphere of King; an alternate modified isothermal sphere based on the ad hoc stellar distribution function of Wilson; and asymptotic power-law models with constant-density cores—to the surface-brightness profile of each cluster.

(7) Surface-brightness data for the LMC, SMC, and Fornax clusters are based in large part on the work of Mackey & Gilmore, but include significant supplementary data culled from the literature and important corrections to Mackey & Gilmore's V-band magnitude scale. The profiles of Galactic globular clusters are taken from Trager et al. We address the question of which model fits each cluster best, finding in the majority of cases that the Wilson models—which are spatially more extended than King models but still include a finite, "tidal" cutoff in density—fit clusters of any age, in any galaxy, as well as or better than King models. Untruncated, asymptotic power laws often fit about as well as Wilson models but can be significantly worse. We argue that the extended halos known to characterize many Magellanic Cloud clusters may be examples of the generic envelope structure of self-gravitating star clusters, not just transient features associated strictly with young age.

$$\left|G^{(1)} - G^{(2)}\right| e^{-(\widehat{M}_{13})^{(1)}t} \leq \qquad (186)$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)} + (a'_{13})^{(1)} + (\widehat{A}_{13})^{(1)} + (\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right) d\left(\left(G^{(1)}, T^{(1)}; G^{(2)}, T^{(2)}\right)\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ *and* $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13,14,15$ depend only on T_{14} and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(1)}t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$: (187)

Remark 3: if G_{13} is bounded, the same property have also G_{14} *and* G_{15} . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a'_{14})^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2 / (a'_{15})^{(1)}$$

If G_{14} *or* G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} *is* bounded, from below, the same property holds for G_{14} *and* G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. (188)

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}(G(t),t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right)$, $t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded.
The same property holds for T_{46} if $\lim_{t\to\infty}(b''_{46})^{(9)}\left((G_{47})(t),t\right) = (b'_{46})^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

If $0 < (\nu_1)^{(7)} \leq (\bar{\nu}_1)^{(7)} \leq \boxed{(\nu_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}}$, we obtain 419

$$(\nu_1)^{(7)} \leq \nu^{(7)}(t) \leq \frac{(\bar{\nu}_1)^{(7)}+(\bar{C})^{(7)}(\bar{\nu}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}}{1+(\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}} \leq (\nu_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(7)}(t)$:-

$$(m_2)^{(7)} \leq \nu^{(7)}(t) \leq (m_1)^{(7)}, \quad \boxed{\nu^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(7)}(t)$:- 420

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad \boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{36})^{(7)} = (a''_{37})^{(7)}, then\ (\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(\nu_1)^{(7)} = (\bar{\nu}_1)^{(7)}$ if in addition $(\nu_0)^{(7)} = (\nu_1)^{(7)}$ then $\nu^{(7)}(t) = (\nu_0)^{(7)}$ and as a consequence $G_{36}(t) = (\nu_0)^{(7)}G_{37}(t)$ **this also defines** $(\nu_0)^{(7)}$ **for the special case** .

ASYMPTOTIC STABILITY ANALYSIS 571

Theorem 7: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(7)}$ *and* $(b_i'')^{(7)}$ Belong to $C^{(7)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of $\mathbb{G}_i, \mathbb{T}_i$:- 572

$$G_i = G_i^{*} + \mathbb{G}_i \qquad , T_i = T_i^{*} + \mathbb{T}_i$$

$$\frac{\partial(a_{37}'')^{(7)}}{\partial T_{37}}(T_{37}^{*}) = (q_{37})^{(7)} \quad , \frac{\partial(b_i'')^{(7)}}{\partial G_j}\left((G_{39})^{**}\right) = s_{ij}$$

Then taking into account equations and neglecting the terms of power 2, we obtain from

$$\frac{d\mathbb{G}_{36}}{dt} = -\left((a_{36}')^{(7)} + (p_{36})^{(7)}\right)\mathbb{G}_{36} + (a_{36})^{(7)}\mathbb{G}_{37} - (q_{36})^{(7)}G_{36}^{*}\mathbb{T}_{37} \quad 573$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

Dark Matter: Obscurantist Scatoma

INTRODUCTION—VARIABLES USED

No sign of dark matter in underground experiment LUX, the most sensitive dark matter detector yet, fails to capture mysterious particles. Eugenie Samuel Reich 30 October 2013 The LUX dark-matter experiment uses photomultiplier tubes to amplify flashes of light from particle collisions. C.H. FAHAM/LUXDARKMATTER

A US team that claims to have built the world's most sensitive dark matter detector has completed its first data run without seeing any sign of the stuff.

In a webcast presentation today at the Sanford Underground Laboratory in Lead, South Dakota, physicists working on the Large Underground Xenon (LUX) experiment said they had seen nothing statistically compelling in 110 days of data-taking. "We find absolutely no events consistent with any kind of dark matter," says LUX co-spokesman Rick Gaitskell, a physicist at Brown University in Providence, Rhode Island.

(1) Physicists know from astronomical observations that 85% of the Universe's matter is dark, making itself known only through (e) its gravitational pull on conventional matter.
(2) Some think it may also engage in weak but detectable collisions (e&eb) with ordinary matter, and several direct detection experiments have reported tantalizing hints of these candidate dark matter particles, known as WIMPs (Weakly Interacting Massive Particles). Gaitskell says that it is now overwhelmingly likely that earlier sightings were statistical fluctuations.
(3) LUX contains more than 300 kilograms of liquid xenon held 1,480 metres underground at the Sanford lab, where rock shields (e) it from the confounding effects of cosmic rays striking Earth's surface.
(4) The hope is that dark matter particles, passing through Earth, will occasionally hit xenon nuclei, causing (eb) flashes of light that can be picked up by the experiment's 122 photomultiplier tubes, situated in arrays above and below the xenon
(5) But only 160 events were seen, a level consistent with background levels of radioactivity from the materials making up the experiment, and well short of what would be expected if candidate dark matter particles seen by previous experiments were real, says Gaitskell.
(6) LUX has now set a limit (e) on dark matter particle interactions that is two to five times more stringent than its closest rival, an experiment called XENON-100 in Gran Sasso National Laboratory near L'Aquila, Italy. In 2011, XENON-100 also saw no evidence for dark matter, but had been criticized for not being sensitive enough to very low-mass dark matter particles tentatively reported by other experiments.
(7) LUX has five times the sensitivity of (e) XENON-100 in the low-mass realm, which should allay those concerns, says Gaitskell.
(8) Despite the no-shows at XENON-100 and LUX, Laura Baudis, a physicist on XENON-100 at the University of Zurich in Switzerland says physicists are not ready to give up on the idea of detecting WIMPs. They may simply have a lower mass, or may be more weakly interacting than originally hoped. "We have some way to go," she says. Baudis adds that LUX's results may (e) help the US$10 million experiment to win further funding.
(9) The LUX team hopes to scale (e) up to seven tonnes of xenon in a $30 million upgrade called LUX-ZEPLIN.
(10) The US Department of Energy is currently deciding which of three experiments to fund: LUX-ZEPLIN; an upgrade to solid-state silicon detectors called the Super Cryogenic Dark Matter Search, to (e) be based initially in the Soudan mine in Minnesota; and an argon-based liquid

detector called DarkSide, also at Gran Sasso. Juan Collar, a dark-matter physicist at the University of Chicago in Illinois, agrees that LUX's solid results will boost its chances of being selected.

(11) On the other hand, he says that it would be more strategic for the Energy Department to fund one of the other two experiments, because (e) they would develop other detection materials

(12) European governments and the US National Science Foundation have already agreed to upgrade XENON-100 to the one-tonne level. More than one large-scale xenon experiment may not be necessary, Collar says. “Everyone acknowledges that what this field needs (e) is a variety of targets.” Nature doi:10.1038/nature.2013.14057 Related stories and links From nature.com Final word is near on dark-matter signal 22 October 2013 Dark matter no-show confronts supersymmetry 14 April 2011 A CoGeNT result in the hunt for dark matter 26 February 2010 From elsewhere LUX Sanford Lab Author information

Super weakly Interacting Massive Particles Jonathan L. Feng et al

(13) Authors investigate a new class of dark matter: super weakly interacting massive particles (super-WIMPs). As with conventional WIMPs, super-WIMPs appear (eb) in well motivated particle theories with naturally the correct relic density.

(14) In contrast to WIMPs, however, super-WIMPs are (=) impossible to detect in all conventional dark matter searches.

(15) Authors consider the concrete examples of gravitino and graviton cold dark matter in models with supersymmetry and universal extra dimensions, respectively, and show (eb) that super-WIMP dark matter satisfies stringent constraints from big bang nucleosynthesis and the cosmic microwave background. © 2003 The American Physical Society URL: http://link.aps.org/doi/10.1103/PhysRevLett.91.011302 DOI: 10.1103/PhysRevLett.91.011302

Unity of all elementary particles: Howard Georgi et al.,

(16) strong, em, and weak forces are conjectured to arise from (e) a single fundamental interaction based on the gauge group SU(5). Note that these forces are present in every system taken in to consideration and characterstics of these systems are taken in to account in the classification schema.

(17) Weak and electromagnetic forces are mediated (e&eb) by the vector bosons of a gauge invariant theory with spontaneous symmetry breaking.

(18) Model describing the interactions of leptons using gauge group SU(2)XSU(1) was first proposed by Glashow, and was improved(eb) by incorporation of spontaneous symmetry breaking

(19) This scheme can also describe hadrons and is just one example of infinite class of models compatible with (=) observed weak interaction phenomenology

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\left|G^{(1)} - G^{(2)}\right| e^{-(\widehat{M}_{13})^{(1)}t} \leq \qquad (186)$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)} + (a'_{13})^{(1)} + (\widehat{A}_{13})^{(1)} + (\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right) d\left(\left(G^{(1)}, T^{(1)}; G^{(2)}, T^{(2)}\right)\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ *and* $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13{,}14{,}15$ depend only on T_{14} and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(1)}t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$: (187)

Remark 3: if G_{13} is bounded, the same property have also G_{14} *and* G_{15} . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a'_{14})^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2 / (a'_{15})^{(1)}$$

If G_{14} *or* G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} *is* bounded, from below, the same property holds for G_{14} *and* G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. (188)

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}(G(t),t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1$ and to choose 190

Remark 43: if G_{44} is bounded, the same property have also $G_{45}\ and\ G_{46}$. indeed if

$G_{44}<(\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt}\le\left((\widehat{M}_{44})^{(9)}\right)_1-(a'_{45})^{(9)}G_{45}$ and by integrating

$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1/(a'_{45})^{(9)}$

In the same way , one can obtain

$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2/(a'_{46})^{(9)}$

If G_{45} *or* G_{46} is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for G_{45} *and* G_{46} . The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t),t\right) = (b'_{45})^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t),t\right) < \varepsilon_9, T_{44}(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right)$, $t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded.
The same property holds for T_{46} if $\lim_{t\to\infty}(b''_{46})^{(9)}\left((G_{47})(t),t\right) = (b'_{46})^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$$\nu^{(7)}(t) \leq \frac{(\bar{\nu}_1)^{(7)} + (\bar{C})^{(7)}(\bar{\nu}_2)^{(7)} e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)} e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(7)} = \frac{(\bar{\nu}_1)^{(7)} - (\nu_0)^{(7)}}{(\nu_0)^{(7)} - (\bar{\nu}_2)^{(7)}}}$$

From which we deduce $(\nu_0)^{(7)} \leq \nu^{(7)}(t) \leq (\bar{\nu}_1)^{(7)}$

If $0 < (\nu_1)^{(7)} < (\nu_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (\bar{\nu}_1)^{(7)}$ we find like in the previous case, 418

$$(\nu_1)^{(7)} \leq \frac{(\nu_1)^{(7)}+(C)^{(7)}(\nu_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)}-(\nu_2)^{(7)}\right)t\right]}}{1+(C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)}-(\nu_2)^{(7)}\right)t\right]}} \leq \nu^{(7)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(7)}+(\bar{C})^{(7)}(\bar{\nu}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}}{1+(\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}} \leq (\bar{\nu}_1)^{(7)}$$

If $0 < (\nu_1)^{(7)} \leq (\bar{\nu}_1)^{(7)} \leq \boxed{(\nu_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}}$, we obtain 419

$$(\nu_1)^{(7)} \leq \nu^{(7)}(t) \leq \frac{(\bar{\nu}_1)^{(7)}+(\bar{C})^{(7)}(\bar{\nu}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}}{1+(\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}} \leq (\nu_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(7)}(t)$:-

$$(m_2)^{(7)} \leq \nu^{(7)}(t) \leq (m_1)^{(7)}, \quad \boxed{\nu^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$$

In a completely analogous way, we obtain

Theorem 6: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(6)}$ *and* $(b_i'')^{(6)}$ Belong to $C^{(6)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of $\mathbb{G}_i, \mathbb{T}_i$:- 564

$$G_i = G_i^* + \mathbb{G}_i \qquad , T_i = T_i^* + \mathbb{T}_i$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

Dark Matter: Final Word?

INTRODUCTION—VARIABLES USED

Final word is near on dark-matter signal An influential US experiment prepares to release its first results. Eugenie Samuel Reich 22 October 2013 Corrected: 24 October 2013 LUXDARKMATTER

(1) Viewed end on, the arrays of photomulti-plier tubes on the Large Underground Xenon (LUX) experiment look like beds of flowers. The hope is that they will capture (e) sparks of light emitted when particles of dark matter collide with liquid xenon.

(2) With 122 detector tubes, LUX is (=) much more sensitive than its closest rivals in the competitive field of dark-matter searches — and in just days, physicists the world over will know whether that advantage has yielded definitive results.

(3) The project, based at the Sanford Underground Research Facility in Lead, South Dakota, will release its first findings on 30 October. They are likely to reveal (eb) whether tentative dark-matter signals seen by other experiments are real, and will also inform ongoing discussions about how much more time and money should be spent on the hunt for dark matter. "The potential is there, and all the community is waiting with bated breath to see what they observe," says Juan Collar, a physicist who leads a rival experiment at the University of Chicago in Illinois.

(4) Elena Aprile, a physicist at Columbia University in New York City who leads another competitor, XENON100, based at Gran Sasso National Laboratory near L'Aquila, Italy, is betting that LUX has not seen dark matter. "A null result is (=) all that can be expected at this stage," she says. A LUX spokesman, physicist Daniel McKinsey of Yale University in New Haven, Connecticut, says simply: "We have a detector that is working very, very well."

(5) LUX came online this year amid fierce debate. Scientists know from astronomical observations that five-sixths of the matter in the Universe is (=) dark — making itself known mostly through its gravitational tug on bright matter — but attempts to detect it directly, on its presumed passage through Earth, have been fraught with controversy.

(6) The DAMA/LIBRA experiment (Dark Matter Large Sodium Iodide Bulk for Rare Processes) at Gran Sasso reported a statistically significant signal more than 10 years ago, but physicists have not independently confirmed the result. In 2010, the Coherent Germanium Neutrino Technology experiment in Soudan, Min-nesota, and the Cryogenic Dark Matter Search at the University of California, Berkeley, each reported tantalizing, but not statistically convincing, glimpses of potential dark matter; a year later, XENON100 saw (e) no sign of the stuff. That prompted heated discussion over whether the experiment was sensitive to the lighter dark-matter particles that might have been glimpsed by the other two experiments.

(7) Enter LUX, which will deliver its first results just as the US Department of Energy decides which of several dark-matter experiments should be given money to expand. LUX wants to install a larger, 7-tonne detector, in a proposed US$30-million project called LUX–Zeplin. McKinsey argues that such experiments should be scaled up until they hit a physical limit — when the background noise from other weakly interacting particles becomes(=) overwhelming. "That's a natural break point," agrees Jonathan Feng, a theoretical physicist at the University of California, Irvine.

(8) One candidate for dark matter is (=) the neutral-ino, a particle predicted by some supersymmetric theories of particle physics, in which particles are paired with heavier counterparts.

(9) If, as Feng expects, LUX sets a detection threshold around three times more stringent than that of XENON100, it will rule (e) out some types of neutralino.

(10) "There's an unbelievable amount of effort focused on the neutralino, so this upcoming announcement is quite important," he says. Nature 502, 421 (24 October 2013) doi: 10.1038/502421a This story wrongly said that Jonathan Feng thought the LUX results could rule out all types of neutralino. In fact he thinks only some types will be ruled out. The text has now been corrected.

Unity of all elementary particles: Howard Georgi et al.,

(11) Observed leptons may be described by (e) six left hand Weyl fields and their charge conjugates
(12) If the gauge couplings donot mix leptons with quarks these six fields must transform(e7eb0 as a representations of the gauge group
(13) One of the representations of the 23 subgroups of U(6) containing an SU(2) X U(1) subgroup in which the leptons behave (e&eb) as they do in Weinberg model
(14) Towards the end of inclusion of hadrons in the theory we must(e) use GIM(Glashow-Illipoulos-Malani) model

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,\mathrm{t}]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \quad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\hat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on

$G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 19 to 24 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i\,(t) \geq T_i^0 e^{\left(-(b_i')^{(1)} t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2 / (a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If $G_{13}\ \ is$ bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$. The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t), t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}\,(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}$, $\frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1$ and to choose 190

$(\hat{P}_{16})^{(2)}\ and\ (\hat{Q}_{16})^{(2)}$ large to have

It results

$$\left|\tilde{G}_{44}^{(1)} - \tilde{G}_i^{(2)}\right| \leq \int_0^t (a_{44})^{(9)}\left|G_{45}^{(1)} - G_{45}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\,ds_{(44)} +$$
$$\int_0^t\{(a'_{44})^{(9)}\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{-(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right)\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right) - (a''_{44})^{(9)}\left(T_{45}^{(2)}, s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval [0, t]

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)} - G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t} \leq$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)}(\widehat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)}, (T_{47})^{(1)};\ (G_{47})^{(2)}, (T_{47})^{(2)})\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ *and* $(\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i = 44,45,46$ depend only on T_{45} and respectively on $(G_{47})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 99 to 44 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(9)} - (a_i'')^{(9)}(T_{45}(s_{(44)}), s_{(44)})\} ds_{(44)}\right]} \geq 0$$

$$T_i\,(t) \geq T_i^0 e^{(-(b_i')^{(9)} t)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2\ and\ \left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also $G_{45}\ and\ G_{46}$. indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a_{45}')^{(9)} G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1 / (a_{45}')^{(9)}$$

In the same way , one can obtain

$$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2 / (a_{46}')^{(9)}$$

If $G_{45}\ or\ G_{46}$ is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for $G_{45}\ and\ G_{46}$. The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t), t\right)) = (b_{45}')^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t), t\right) < \varepsilon_9, T_{44}\,(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right), \quad t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded.
The same property holds for T_{46} if $\lim_{t\to\infty}(b_{46}'')^{(9)}\left((G_{47})(t), t\right) = (b_{46}')^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

Proof : From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14},t)\right) - (a''_{14})^{(1)}(T_{14},t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^{0}}{G_{14}^{0}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)}+(C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \le \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \le \nu^{(1)}(t) \le (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \le \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \le \nu^{(1)}(t) \le$$

$$\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \le (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \le (\bar{\nu}_1)^{(1)} \le \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)} \le \nu^{(1)}(t) \le \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \le (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(1)}(t)$:-

$$(m_2)^{(1)} \le \nu^{(1)}(t) \le (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \le u^{(1)}(t) \le (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)}G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

Proof : From global equations we obtain 387

$$\frac{dv^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t)\right) - (a''_{17})^{(2)}(T_{17}, t)v^{(2)} - (a_{17})^{(2)}v^{(2)}$$

Definition of $v^{(2)}$:- $\boxed{v^{(2)} = \frac{G_{16}}{G_{17}}}$ 388

It follows 389

$$-\left((a_{17})^{(2)}\left(v^{(2)}\right)^2 + (\sigma_2)^{(2)}v^{(2)} - (a_{16})^{(2)}\right) \leq \frac{dv^{(2)}}{dt} \leq -\left((a_{17})^{(2)}\left(v^{(2)}\right)^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)}\right)$$

From which one obtains 390

Definition of $(\bar{v}_1)^{(2)}, (v_0)^{(2)}$:-

For $0 < (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (v_1)^{(2)} < (\bar{v}_1)^{(2)}$

$$v^{(2)}(t) \geq \frac{(v_1)^{(2)} + (C)^{(2)}(v_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((v_1)^{(2)} - (v_0)^{(2)}\right)t\right]}}{1 + (C)^{(2)}e^{\left[-(a_{17})^{(2)}\left((v_1)^{(2)} - (v_0)^{(2)}\right)t\right]}} \quad , \quad \boxed{(C)^{(2)} = \frac{(v_1)^{(2)} - (v_0)^{(2)}}{(v_0)^{(2)} - (v_2)^{(2)}}}$$

it follows $(v_0)^{(2)} \leq v^{(2)}(t) \leq (v_1)^{(2)}$

In the same manner , we get 391

Dark Matter: Gerry Mandering Goosander?

INTRODUCTION—VARIABLES USED

Published online 14 April 2011 | Nature | doi:10.1038/news.2011.235 News Dark matter no-show confronts supersymmetry The XENON100 experiment has placed the tightest limits yet on the properties of dark matter. Eugenie Samuel Reich

(1) The XENON100 experiment did not see any dark matter particles, but it did set (eb) new limits on supersymmetry.
(2) After months of battling radioactive contamination that threatened to swamp its detector, the XENON100 collaboration has managed to place the strongest limits (e) yet on the detection of dark matter.
(3) The no-show, announced today at a seminar in Gran Sasso National Laboratory in Italy, places constraints (e) on supersymmetry, the leading alternative to the standard model of particle physics.
(4) Dark matter is (=) thought to make up 83% of the matter in the Universe, and a number of experiments are competing to be the first to detect its rare interactions with ordinary matter.
(5) XENON100 looks for proposed dark-matter particles called weakly interacting massive particles (WIMPs) as they pass through the central portion of 161 kilograms of liquid xenon beneath 1.4 kilometres of rock at Gran Sasso. The particles should produce (eb) electric charge and light signals as they collide with xenon nuclei.
(6) In a paper published online last night, the XENON100 researchers report three events detected during a 100-day run of the experiment last year that might have been due (e) to dark matter.
(7) However, as they expected to see between 1.2 and 2.4 background events — interactions mostly caused by a radioactive contaminant in the xenon — their result is (=) statistically negative and

therefore rules out the existence of many of the more strongly interacting and heavier WIMPs.

(8) "We were of course hoping to see evidence of dark matter and we didn't, but we did have a very high sensitivity," says particle physicist Laura Baudis of the University of Zurich in Switzerland, and a group leader in the XENON100 collaboration. Baudis notes that contamination was higher than hoped, and higher than in a previous experimental run2, because (e) of a leak in the experiment. However, she says, it is still much lower than that in many other experiments, and low enough that the group can be confident in its findings.

(9) The new findings significantly constrain (e)supersymmetry

(10) Supersymmetry theory predicts (eb) the existence of a host of particles that physicists are hoping to detect through collisions in the Large Hadron Collider (LHC) at CERN, Europe's particle-physics lab in Geneva, Switzerland.

(11) The lightest of the particles predicted by supersymmetry may (=) also be a WIMP.

(12) In their paper, the XENON100 researchers report that their result is the first to cut (e) into the region of heavier WIMPS that is also accessible by the LHC. Baudis says that it also contradicts reports of the lighter WIMPs that the Dark Matter experiment (DAMA) in Gran Sasso, and Coherent Germanium Neutrino Technology (CoGeNT) experiment in the Soudan mine in Minnesota claimed to detect.

WIMP limits

Dan Hooper, a theoretical physicist at Fermilab in Batavia, Illinois, says that he is enthusiastic about the limits the XENON100 collaboration have placed on heavier WIMPs. But he questions whether the detector is sensitive enough to lighter ones to challenge the DAMA and CoGeNT findings. "I'm a little more sceptical about that," he says. Juan Collar, a cosmologist at the University of Chicago in Illinois, who works on CoGeNT, agrees. He says that a lot rests on the calibration of the XENON100 detector, which he will be looking to study in detail. "Previous attempts by the XENON collaboration to calibrate the response of their detector contained traceable mistakes in methodology," he says3. Only if his analysis confirms the calibration would he be sure that the experiment is in conflict with the DAMA and CoGeNT results.

(13) The previous record ruled (e) out WIMPS that were five times more likely to interact with ordinary matter as the new results, and was set in 2010 by XENON100 and the Cryogenic Dark Matter Search (CDMS), another experiment in the Soudan mine that is looking for WIMPs hitting the nuclei of atoms in germanium crystals.

(14) CDMS member Sunil Golwala of California Institute of Technology in Pasadena says that XENON100's latest result is (=) "impressive".

(15) He adds that the sudden rate of progress — improving constraints by a factor of five in just a year — is typical for this type of experiment, which is able to progress fast until its level of background becomes(=) close to the level of the signal it is looking for.

(16) That point seems to have been reached now, so, he says, improving greatly on the current results will require (e) the construction of larger detectors, to give WIMPS a greater mass of detector to collide with and produce a signal.

(17) The XENON100 collaboration hopes eventually to scale up to (e) use as much as one tonne of xenon, which will be 100 times more sensitive to potential WIMPS.

(18) Another large-scale xenon experiment expected to come online by the end of this year is the Large Underground Xenon (LUX) detector, which will search for dark matter using 350 kilograms of liquid xenon placed underground in the Sanford Underground Laboratory at Homestake, South Dakota. LUX physicist Rick Gaitskell of Brown University in Rhode Island is upbeat about XENON100's result. "From our point of view this is very exciting because(e) we're seeing a result from the new generation of xenon detectors that is a significant improvement over any other

competing technology," he says, adding that the sensitivity of XENON100 bodes well for LUX's chances of finding dark matter — or ruling it out.

A CoGeNT result in the hunt for dark matter an underground experiment may have detected a type of dark-matter particle. (19) Deep in the Soudan mine in Minnesota, some 700 metres below ground amid the bones of bats, sits the huge Cryogenic Dark Matter Search (CDMSII) experiment, which at its heart contains (e) a rack of supercooled hockey-puck-sized silicon and germanium detectors nestled within Russian-doll layers of shielding.

(20) Two weeks ago, the CDMSII collaboration published a paper showing that two particles had penetrated its (e&eb) detector's defences — particles that, given the lack of any other particle activity down in the frigid quiet of the detectors, looked very much like dark matter1.

(21) Dark matter is (=) thought to make up 85% of the mass in the Universe, but has not been detected directly — quite. The attention-grabbing claim of the CDMSII collaboration has many physicists thinking — but not yet convinced — that the team could be on to something.

(22) Just a stone's throw from the CDMSII experiment, across the subterranean cavern, lies a far smaller box that is thickening the dark-matter plot. The box contains a single germanium hockey puck, similar to those in the CDMSII experiment but operated by the Coherent Germanium Neutrino Technology (CoGeNT) collaboration and tuned (e&eb) to detect incoming particles with much lower masses than the CDMSII. It began collecting data in December 2009, and, after just 56 days, the group is reporting hundreds of particle strikes that cannot be explained other than by invoking dark matter.

(23) "If it's real, we're looking at a very beautiful dark-matter signal," says Juan Collar, a physicist at the University of Chicago and CoGeNT spokesperson. Collar presented the work today at a dark-matter conference at the University of California, Los Angeles. The results were posted on the preprint server Arxiv yesterday2."If it's real, we're looking at a very beautiful dark-matter signal."

(24) Confirmation of the result — and Collar is careful to say that it is still early days — would radically shift attention to experiments that are sensitive to lower energies. The CoGeNT experiment looks (e&eb) for a type of dark-matter particle called a WIMP, or Weakly Interacting Massive Particle.

(25) The new data point to a WIMP with a mass in the range of 7–11 billion electronvolts. Theorists have conjured (eb) up hundreds of mathematically consistent models for producing WIMPs of different masses in the early Universe, and the particles detected by CoGeNT fit well in the realm of the theoretically possible.

(26) But the majority of models had favoured WIMP particles that are(=) an order of magnitude heavier, and some experiments — such as the CDMSII, and those using large tanks filled with mineral oil or liquefied noble gases — were aiming for that territory. "The experiments designed to look at the heavier particles aren't going to like the CoGeNT result," says Dan Hooper, a theorist at the Fermi National Accelerator Laboratory in Batavia, Illinois.

Swimming in dark matter

(27) On its own, the coGeNT result is just yet another tentative claim in a sea of dark-matter hints. And Collar himself acknowledges that the coGeNT detector is not shielded as well as the CDMSII experiment, so the signal he's seeing could simply be (=) an unexplained radioactive decay process in the electronics.

(28) But the fact that the CoGeNT results mesh (e&eb) so well with those of the CDMSII and one other

experiment is what gets the attention of Neal Weiner, a theorist at New York University. "I think this will make some noise," says Weiner. "It lines up nicely with the possible interpretation of other results."

(29) The WIMP called for by the CoGeNT result is consistent (=) with the two CDMSII 'hits', but because those events lay at the lower reaches of CDMSII's energy sensitivities, researchers will have a hard time sifting for more.

(30) The second experiment that matches up with the CoGeNT result is (=) the strange signal seen in a deep underground detector in Gran Sasso, Italy, by the DAMA/LIBRA collaboration (Dark Matter Large Sodium Iodide Bulk for Rare Processes) (see 'Italian group claims to see dark matter - again').

(31) For a decade, the Italian team has found a periodic signal that won't go away; the effect has been put down to Earth annually passing through a steady current of dark matter in the Milky Way.

(32) The particles seen by CoGeNT are much lower in mass than (eb) the regions of parameter space currently being investigated by space satellites such as the Fermi Gamma-ray Space Telescope and the Payload for Antimatter Matter Exploration and Light-nuclei Astrophysics (PAMELA), which have also found dark matter hints — but for heavier particles (see 'Dark matter intrigue deepens').

(33) But Weiner points out that whereas the CoGeNT result will raise(eb) doubts about what the space experiments are seeing, they won't undermine them completely;

(34) It's entirely possible that all of the dark matter seen indirectly in the cosmos could be comprised (e) of both light and heavy particles.

(35) So he doesn't want the planned higher-mass detectors to(=) be mothballed just yet. "This won't put any of the detectors out of business," says Weiner. "We should be cautious."

$$(b_i'')^{(9)}(G_{47},t)\le\ (r_i)^{(9)}\le(b_i')^{(9)}\le(\hat{B}_{44})^{(9)}$$

$$\lim_{T_2\to\infty}(a_i'')^{(9)}(T_{45},t)=(p_i)^{(9)}$$

$$\lim_{G\to\infty}(b_i'')^{(9)}(G_{47},t)=\ (r_i)^{(9)}$$

Definition of $(\hat{A}_{44})^{(9)},(\hat{B}_{44})^{(9)}$:

Where $\boxed{(\hat{A}_{44})^{(9)},(\hat{B}_{44})^{(9)},(p_i)^{(9)},\ (r_i)^{(9)}}$ are positive constants and $\boxed{i=44,45,46}$

They satisfy Lipschitz condition:

$$|(a_i'')^{(9)}(T_{45}',t)-(a_i'')^{(9)}(T_{45},t)|\le(\hat{k}_{44})^{(9)}|T_{45}-\ T_{45}'|e^{-(\widehat{M}_{44})^{(9)}t}$$

$$|(b_i'')^{(9)}((G_{47})',t)-(b_i'')^{(9)}\big((G_{47}),t\big)|<(\hat{k}_{44})^{(9)}||(G_{47})-(G_{47})'||e^{-(\widehat{M}_{44})^{(9)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(9)}(T_{45}',t)$

and $(a_i'')^{(9)}(T_{45},t)$. (T_{45}',t) and (T_{45},t) are points belonging to the interval $\left[(\hat{k}_{44})^{(9)},(\hat{M}_{44})^{(9)}\right]$. It is to be noted that $(a_i'')^{(9)}(T_{45},t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{44})^{(9)}=1$ then the function $(a_i'')^{(9)}(T_{45},t)$, the **first augmentation coefficient** attributable to the system, would be absolutely continuous.

Definition of $(\hat{M}_{44})^{(9)},(\hat{k}_{44})^{(9)}$:

$(\hat{M}_{44})^{(9)},(\hat{k}_{44})^{(9)},$ are positive constants

$$\frac{(a_i)^{(9)}}{(\hat{M}_{44})^{(9)}}\ ,\frac{(b_i)^{(9)}}{(\hat{M}_{44})^{(9)}}<1$$

Definition of $(\hat{P}_{44})^{(9)},(\hat{Q}_{44})^{(9)}$:

There exists two constants $(\hat{P}_{44})^{(9)}$ and $(\hat{Q}_{44})^{(9)}$ which together with $(\hat{M}_{44})^{(9)},(\hat{k}_{44})^{(9)},(\hat{A}_{44})^{(9)} and\ (\hat{B}_{44})^{(9)}$ and the constants $(a_i)^{(9)},(a_i')^{(9)},(b_i)^{(9)},(b_i')^{(9)},(p_i)^{(9)},\ (r_i)^{(9)},i=44,45,46,$ satisfy the inequalities

$$\frac{1}{(\hat{M}_{44})^{(9)}}[(a_i)^{(9)}+(a_i')^{(9)}+\ (\hat{A}_{44})^{(9)}+\ (\hat{P}_{44})^{(9)}\ (\hat{k}_{44})^{(9)}]<1$$

Indeed if we denote

Definition of $\tilde{G},\tilde{T}:\left(\tilde{G},\tilde{T}\right)=\mathcal{A}^{(1)}(G,T)$

It results

$$\left|\tilde{G}_{13}^{(1)}-\tilde{G}_i^{(2)}\right|\leq\int_0^t(a_{13})^{(1)}\left|G_{14}^{(1)}-G_{14}^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}s_{(13)}}e^{(\widehat{M}_{13})^{(1)}s_{(13)}}\,ds_{(13)}+$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,\mathrm{t}]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \quad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\hat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on

$G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 19 to 24 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i\,(t) \geq T_i^0 e^{\left(-(b_i')^{(1)} t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2 / (a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If $G_{13}\ \ is$ bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$. The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t), t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}\,(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.

From the hypotheses it follows

$$\left|(G_{43})^{(1)} - (G_{43})^{(2)}\right|e^{-(\widehat{M}_{40})^{(8)}t} \leq \quad 273$$
$$\frac{1}{(\widehat{M}_{40})^{(8)}}\left((a_{40})^{(8)} + (a'_{40})^{(8)} + (\widehat{A}_{40})^{(8)} + (\widehat{P}_{40})^{(8)}(\hat{k}_{40})^{(8)}\right)d\left(((G_{43})^{(1)}, (T_{43})^{(1)};\ (G_{43})^{(2)}, (T_{43})^{(2)})\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis the result follows

Remark 36: The fact that we supposed $(a''_{40})^{(8)}$ and $(b''_{40})^{(8)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by 274

$(\widehat{P}_{40})^{(8)}e^{(\widehat{M}_{40})^{(8)}t}$ *and* $(\widehat{Q}_{40})^{(8)}e^{(\widehat{M}_{40})^{(8)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(8)}$ and $(b_i'')^{(8)}, i = 40{,}41{,}42$ depend only on T_{41} and respectively on $(G_{43})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 37 There does not exist any t where $G_i(t) = 0\ and\ T_i(t) = 0$ 275

it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(8)} - (a_i'')^{(8)}(T_{41}(s_{(40)}), s_{(40)})\} ds_{(40)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(8)}t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{40})^{(8)}\right)_1, \left((\widehat{M}_{40})^{(8)}\right)_2\ and\ \left((\widehat{M}_{40})^{(8)}\right)_3$: 276

Remark 38: if G_{40} is bounded, the same property have also $G_{41}\ and\ G_{42}$. indeed if

$G_{40} < (\widehat{M}_{40})^{(8)}$ it follows $\frac{dG_{41}}{dt} \leq \left((\widehat{M}_{40})^{(8)}\right)_1 - (a_{41}')^{(8)}G_{41}$ and by integrating

$$G_{41} \leq \left((\widehat{M}_{40})^{(8)}\right)_2 = G_{41}^0 + 2(a_{41})^{(8)}\left((\widehat{M}_{40})^{(8)}\right)_1/(a_{41}')^{(8)}$$

In the same way , one can obtain

$$G_{42} \leq \left((\widehat{M}_{40})^{(8)}\right)_3 = G_{42}^0 + 2(a_{42})^{(8)}\left((\widehat{M}_{40})^{(8)}\right)_2/(a_{42}')^{(8)}$$

If $G_{41}\ or\ G_{42}$ is bounded, the same property follows for G_{40} , G_{42} and G_{40} , G_{41} respectively.

Remark 39: If G_{40} *is* bounded, from below, the same property holds for $G_{41}\ and\ G_{42}$. The proof is analogous with the preceding one. An analogous property is true if G_{41} is bounded from below. 277

Remark 40: If T_{40} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(8)}((G_{43})(t), t)) = (b_{41}')^{(8)}$ then $T_{41} \to \infty$. 278

Definition of $(m)^{(8)}$ and ε_8 :

Indeed let t_8 be so that for $t > t_8$

$$(b_{41})^{(8)} - (b_i'')^{(8)}\left((G_{43})(t), t\right) < \varepsilon_8, T_{40}(t) > (m)^{(8)}$$

Then $\frac{dT_{41}}{dt} \geq (a_{41})^{(8)}(m)^{(8)} - \varepsilon_8 T_{41}$ which leads to 279

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{\varepsilon_8}\right)(1 - e^{-\varepsilon_8 t}) + T_{41}^0 e^{-\varepsilon_8 t}$ If we take t such that $e^{-\varepsilon_8 t} = \frac{1}{2}$ it results

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{2}\right)$, $t = log\frac{2}{\varepsilon_8}$ By taking now ε_8 sufficiently small one sees that T_{41} is unbounded.
The same property holds for T_{42} if $\lim_{t\to\infty}(b''_{42})^{(8)}\left((G_{43})(t), t(t), t\right) = (b'_{42})^{(8)}$

It is now sufficient to take $\frac{(a_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}$, $\frac{(b_i)^{(9)}}{(\widehat{M}_{44})^{(9)}} < 1$ and to choose $(\widehat{P}_{44})^{(9)}$ and $(\widehat{Q}_{44})^{(9)}$ large to have

$$\frac{(a_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}\left[(\widehat{P}_{44})^{(9)} + \left((\widehat{P}_{44})^{(9)} + G_j^0\right)e^{-\left(\frac{(\widehat{P}_{44})^{(9)}+G_j^0}{G_j^0}\right)}\right] \leq (\widehat{P}_{44})^{(9)}$$

$$\frac{(b_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}\left[\left((\widehat{Q}_{44})^{(9)} + T_j^0\right)e^{-\left(\frac{(\widehat{Q}_{44})^{(9)}+T_j^0}{T_j^0}\right)} + (\widehat{Q}_{44})^{(9)}\right] \leq (\widehat{Q}_{44})^{(9)}$$

In order that the operator $\mathcal{A}^{(9)}$ transforms the space of sextuples of functions G_i , T_i satisfying 39,35,36 into itself
The operator $\mathcal{A}^{(9)}$ is a contraction with respect to the metric

$$d\left(((G_{47})^{(1)}, (T_{47})^{(1)}), ((G_{47})^{(2)}, (T_{47})^{(2)})\right) =$$
$$\sup_i\{\max_{t\in\mathbb{R}_+}\left|G_i^{(1)}(t) - G_i^{(2)}(t)\right|e^{-(\widehat{M}_{44})^{(9)}t}, \max_{t\in\mathbb{R}_+}\left|T_i^{(1)}(t) - T_i^{(2)}(t)\right|e^{-(\widehat{M}_{44})^{(9)}t}\}$$

Indeed if we denote

Definition of $(\widetilde{G_{47}}), (\widetilde{T_{47}}) : \left((\widetilde{G_{47}}), (\widetilde{T_{47}})\right) = \mathcal{A}^{(9)}\left((G_{47}), (T_{47})\right)$
It results

$$\left|\tilde{G}_{44}^{(1)} - \tilde{G}_i^{(2)}\right| \leq \int_0^t (a_{44})^{(9)}\left|G_{45}^{(1)} - G_{45}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\,ds_{(44)} +$$

$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right) - (a''_{44})^{(9)}\left(T_{45}^{(2)}, s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval [0, t]

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)} - G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t} \leq$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)}(\widehat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)}, (T_{47})^{(1)};\ (G_{47})^{(2)}, (T_{47})^{(2)})\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ *and* $(\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t), t\right) < \varepsilon_9, T_{44}\,(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right), \quad t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded.
The same property holds for T_{46} if $\lim_{t\to\infty}(b_{46}'')^{(9)}\left((G_{47})(t), t\right) = (b_{46}')^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

SECTION THIRTY FIVE

Artificial Cognitive Computers?

INTRODUCTION—VARIABLES USED

Scientists map process by which brain cells form long-term memories June 9, 2013 in Neuroscience

(1) Cheu and his team then adapted a mathematical model that describes the activity of a single neuron to **incorporate (e)** specific characteristics of cells in the hippocampus, including their inhibitory activity.
(2) This mathematical model that describes the activity of a single neuron to **incorporate (e)** specific characteristics of cells in the hippocampus, including their inhibitory activity **allowed (eb) them** to model neural networks in the hippocampus that encode short-term memories.
(3) They showed that for successful formation of auto-associative memories, the strength of synapses needs to be within a certain range: if synapses become too strong, the associated neurons **are (eb) activated** at the wrong time and networks become muddled, destroying the memories.
(4) If they are not strong enough, however, activation of some neurons in the network **is not (e) enough** to activate the rest, and memory retrieval fails.
(5) As well as providing (eb) insight into how memories may be stored and retrieved in the brain, Cheu thinks this work also has practical applications.(Kind attention is drawn to Sundry deposit model

for memory recall)

(6) "This study has **significant (eb) implications** in the construction of artificial cognitive computers in the future," he says.

(7) "It helps with developing artificial cognitive memory, in which memory sequences **can (e) be retrieved** by the presentation of a partial query." According to Cheu, one can compare it to a single image being used to retrieve a sequence of images from a video clip. More information: Cheu, E. Y., Yu, J., Tan, C. H. & Tang, H. (8) Transcranial magnetic stimulation (TMS) **is (=) a** noninvasive method to cause depolarization or Hyperpolarization in the neurons of the brain. TMS uses electromagnetic induction to induce weak electric currents using a rapidly changing magnetic field; http://en.wikipedia.org/wiki/Transcr...ic_stimulation

(9) You can induce action potential trains artificially **using** TMS. As far as natural communication between cells, we usually model these as electrochemical interactions. So, although magnetism always goes along with the territory when speaking of these actions, we typically do not invoke it a causal agent in natural brain function.

$$\lim_{T_2 \to \infty} (a_i'')^{(9)}(T_{45}, t) = (p_i)^{(9)}$$

$$\lim_{G \to \infty} (b_i'')^{(9)}(G_{47}, t) = \ (r_i)^{(9)}$$

Definition of $(\hat{A}_{44})^{(9)}, (\hat{B}_{44})^{(9)}$:

Where $\boxed{(\hat{A}_{44})^{(9)}, (\hat{B}_{44})^{(9)}, (p_i)^{(9)}, \ (r_i)^{(9)}}$ are positive constants and $\boxed{i = 44,45,46}$

They satisfy Lipschitz condition:

$$|(a_i'')^{(9)}(T_{45}', t) - (a_i'')^{(9)}(T_{45}, t)| \leq (\hat{k}_{44})^{(9)}|T_{45} - T_{45}'|e^{-(\hat{M}_{44})^{(9)}t}$$

$$|(b_i'')^{(9)}((G_{47})', t) - (b_i'')^{(9)}((G_{47}), t)| < (\hat{k}_{44})^{(9)}||(G_{47}) - (G_{47})'||e^{-(\hat{M}_{44})^{(9)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(9)}(T_{45}', t)$ and$(a_i'')^{(9)}(T_{45}, t)$. (T_{45}', t) and (T_{45}, t) are points belonging to the interval $[(\hat{k}_{44})^{(9)}, (\hat{M}_{44})^{(9)}]$. It is to be noted that $(a_i'')^{(9)}(T_{45}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{44})^{(9)} = 1$ then the function $(a_i'')^{(9)}(T_{45}, t)$, the **first augmentation coefficient** attributable to the system, would be absolutely continuous.

Definition of $(\hat{M}_{44})^{(9)}, (\hat{k}_{44})^{(9)}$:

$(\hat{M}_{44})^{(9)}, (\hat{k}_{44})^{(9)}$, are positive constants

$$\frac{(a_i)^{(9)}}{(\hat{M}_{44})^{(9)}}, \frac{(b_i)^{(9)}}{(\hat{M}_{44})^{(9)}} < 1$$

Definition of $(\hat{P}_{44})^{(9)}, (\hat{Q}_{44})^{(9)}$:

There exists two constants $(\hat{P}_{44})^{(9)}$ and $(\hat{Q}_{44})^{(9)}$ which together with $(\hat{M}_{44})^{(9)}, (\hat{k}_{44})^{(9)}, (\hat{A}_{44})^{(9)} and\ (\hat{B}_{44})^{(9)}$ and the constants $(a_i)^{(9)}, (a_i')^{(9)}, (b_i)^{(9)}, (b_i')^{(9)}, (p_i)^{(9)}, (r_i)^{(9)}, i = 44,45,46,$
satisfy the inequalities

$$\frac{1}{(\hat{M}_{44})^{(9)}}[(a_i)^{(9)} + (a_i')^{(9)} + (\hat{A}_{44})^{(9)} + (\hat{P}_{44})^{(9)} (\hat{k}_{44})^{(9)}] < 1$$

$$\frac{1}{(\hat{M}_{44})^{(9)}}[(b_i)^{(9)} + (b_i')^{(9)} + (\hat{B}_{44})^{(9)} + (\hat{Q}_{44})^{(9)} (\hat{k}_{44})^{(9)}] < 1$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,t]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\le \qquad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\,G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)},i=13{,}14{,}15$ depend only on T_{14} and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t)=0\ and\ T_i(t)=0$

From 19 to 24 it results

$$G_i(t)\ge G_i^0e^{\left[-\int_0^t\{(a_i')^{(1)}-(a_i'')^{(1)}(T_{14}(s_{(13)}),s_{(13)})\}ds_{(13)}\right]}\ge 0$$

$$T_i(t)\ge T_i^0e^{\left(-(b_i')^{(1)}t\right)}>0\quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1,\left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13}<(\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt}\le\left((\widehat{M}_{13})^{(1)}\right)_1-(a'_{14})^{(1)}G_{14}$ and by integrating

$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1/(a'_{14})^{(1)}$

In the same way , one can obtain

$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2/(a'_{15})^{(1)}$

If G_{14} *or* G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} *is* bounded, from below, the same property holds for G_{14} *and* G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t),t)) = (b'_{14})^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 36: The fact that we supposed $(a''_{40})^{(8)}$ and $(b''_{40})^{(8)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{40})^{(8)}e^{(\widehat{M}_{40})^{(8)}t}\ and\ (\widehat{Q}_{40})^{(8)}e^{(\widehat{M}_{40})^{(8)}t}$ respectively of $\mathbb{R}_+$. 274

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(8)}$ and $(b_i'')^{(8)}, i=40,41,42$ depend only on T_{41} and respectively on $(G_{43})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 37 There does not exist any t where $G_i(t)=0\ and\ T_i(t)=0$ 275

it results

$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(8)} - (a_i'')^{(8)}(T_{41}(s_{(40)}), s_{(40)})\} ds_{(40)}\right]} \geq 0$

$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(8)} t\right)} > 0$ for t > 0

Definition of $\left((\widehat{M}_{40})^{(8)}\right)_1, \left((\widehat{M}_{40})^{(8)}\right)_2$ *and* $\left((\widehat{M}_{40})^{(8)}\right)_3$: 276

Remark 38: if G_{40} is bounded, the same property have also G_{41} *and* G_{42} . indeed if

$G_{40} < (\widehat{M}_{40})^{(8)}$ it follows $\frac{dG_{41}}{dt} \leq \left((\widehat{M}_{40})^{(8)}\right)_1 - (a_{41}')^{(8)} G_{41}$ and by integrating

$G_{41} \leq \left((\widehat{M}_{40})^{(8)}\right)_2 = G_{41}^0 + 2(a_{41})^{(8)} \left((\widehat{M}_{40})^{(8)}\right)_1 / (a_{41}')^{(8)}$

In the same way , one can obtain

$G_{42} \leq \left((\widehat{M}_{40})^{(8)}\right)_3 = G_{42}^0 + 2(a_{42})^{(8)} \left((\widehat{M}_{40})^{(8)}\right)_2 / (a_{42}')^{(8)}$

If G_{41} *or* G_{42} is bounded, the same property follows for G_{40} , G_{42} and G_{40} , G_{41} respectively.

Remark 39: If G_{40} *is* bounded, from below, the same property holds for G_{41} *and* G_{42} . The proof is analogous with the preceding one. An analogous property is true if G_{41} is bounded from below. 277

Remark 40: If T_{40} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(8)}((G_{43})(t), t)) = (b_{41}')^{(8)}$ then $T_{41} \to \infty$. 278

Definition of $(m)^{(8)}$ and ε_8 :

Indeed let t_8 be so that for $t > t_8$

$(b_{41})^{(8)} - (b_i'')^{(8)}\left((G_{43})(t), t\right) < \varepsilon_8, T_{40}(t) > (m)^{(8)}$

Then $\frac{dT_{41}}{dt} \geq (a_{41})^{(8)}(m)^{(8)} - \varepsilon_8 T_{41}$ which leads to 279

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{\varepsilon_8}\right)(1 - e^{-\varepsilon_8 t}) + T_{41}^0 e^{-\varepsilon_8 t}$ If we take t such that $e^{-\varepsilon_8 t} = \frac{1}{2}$ it results

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{2}\right), \quad t = log\frac{2}{\varepsilon_8}$ By taking now ε_8 sufficiently small one sees that T_{41} is unbounded.
The same property holds for T_{42} if $\lim_{t\to\infty}(b_{42}'')^{(8)}\left((G_{43})(t), t(t), t\right) = (b_{42}')^{(8)}$

It is now sufficient to take $\frac{(a_i)^{(9)}}{(\hat{M}_{44})^{(9)}}$, $\frac{(b_i)^{(9)}}{(\hat{M}_{44})^{(9)}} < 1$ and to choose $(\hat{P}_{44})^{(9)}$ and $(\hat{Q}_{44})^{(9)}$ large to have 279 A

$$\frac{(a_i)^{(9)}}{(\hat{M}_{44})^{(9)}}\left[(\hat{P}_{44})^{(9)} + \left((\hat{P}_{44})^{(9)} + G_j^0\right)e^{-\left(\frac{(\hat{P}_{44})^{(9)} + G_j^0}{G_j^0}\right)}\right] \leq (\hat{P}_{44})^{(9)}$$

$$\frac{(b_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}\left[\left((\hat{Q}_{44})^{(9)}+T_j^0\right)e^{-\left(\frac{(\hat{Q}_{44})^{(9)}+T_j^0}{T_j^0}\right)}+(\hat{Q}_{44})^{(9)}\right]\leq(\hat{Q}_{44})^{(9)}$$

In order that the operator $\mathcal{A}^{(9)}$ transforms the space of sextuples of functions G_i , T_i satisfying 39,35,36 into itself
The operator $\mathcal{A}^{(9)}$ is a contraction with respect to the metric

$$d\left(((G_{47})^{(1)},(T_{47})^{(1)}),((G_{47})^{(2)},(T_{47})^{(2)})\right)=$$
$$\sup_i\{\max_{t\in\mathbb{R}_+}\left|G_i^{(1)}(t)-G_i^{(2)}(t)\right|e^{-(\widehat{M}_{44})^{(9)}t},\max_{t\in\mathbb{R}_+}\left|T_i^{(1)}(t)-T_i^{(2)}(t)\right|e^{-(\widehat{M}_{44})^{(9)}t}\}$$

Indeed if we denote

Definition of $\widetilde{(G_{47})},\widetilde{(T_{47})}:\left(\widetilde{(G_{47})},\widetilde{(T_{47})}\right)=\mathcal{A}^{(9)}\left((G_{47}),(T_{47})\right)$
It results

$$\left|\tilde{G}_{44}^{(1)}-\tilde{G}_i^{(2)}\right|\leq\int_0^t(a_{44})^{(9)}\left|G_{45}^{(1)}-G_{45}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\,ds_{(44)}+$$
$$\int_0^t\{(a'_{44})^{(9)}\left|G_{44}^{(1)}-G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}+$$
$$(a''_{44})^{(9)}\left(T_{45}^{(1)},s_{(44)}\right)\left|G_{44}^{(1)}-G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}+$$
$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)},s_{(44)}\right)-(a''_{44})^{(9)}\left(T_{45}^{(2)},s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval [0, t]

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t}\leq$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)}+(a'_{44})^{(9)}+(\widehat{A}_{44})^{(9)}+(\widehat{P}_{44})^{(9)}(\widehat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)},(T_{47})^{(1)};\ (G_{47})^{(2)},(T_{47})^{(2)})\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}\ and\ (\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i=44,45,46$ depend only on T_{45} and respectively on $(G_{47})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i\,(t)=0\ and\ T_i\,(t)=0$

From 99 to 44 it results

$$G_i\,(t)\geq G_i^0e^{\left[-\int_0^t\{(a_i')^{(9)}-(a_i'')^{(9)}(T_{45}(s_{(44)}),s_{(44)})\}ds_{(44)}\right]}\geq 0$$

$$T_i\,(t)\geq T_i^0e^{\left(-(b_i')^{(9)}t\right)}>0\quad \text{for t}>0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2$ *and* $\left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also G_{45} *and* G_{46} . indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a'_{45})^{(9)} G_{45}$ and by integrating

$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1/(a'_{45})^{(9)}$

In the same way , one can obtain

$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2/(a'_{46})^{(9)}$

If G_{45} *or* G_{46} is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for G_{45} *and* G_{46} . The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t),t\right) = (b'_{45})^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t),t\right) < \varepsilon_9, T_{44}(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right)$, $t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded.
The same property holds for T_{46} if $\lim_{t\to\infty}(b''_{46})^{(9)}\left((G_{47})(t),t\right) = (b'_{46})^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

Proof : From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \leq \frac{dv^{(1)}}{dt} \leq -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

For $0 < \boxed{(v_0)^{(1)} = \frac{G^0_{13}}{G^0_{14}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \geq \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \leq v^{(1)}(t) \leq (v_1)^{(1)}$

In the same manner , we get 384

$$v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}}$$

From which we deduce $(v_0)^{(1)} \leq v^{(1)}(t) \leq (\bar{v}_1)^{(1)}$

If $0 < (v_1)^{(1)} < (v_0)^{(1)} = \frac{G^0_{13}}{G^0_{14}} < (\bar{v}_1)^{(1)}$ we find like in the previous case, 385

$$(v_1)^{(1)} \leq \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_2)^{(1)}\right)t\right]}}{1 + (C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_2)^{(1)}\right)t\right]}} \leq v^{(1)}(t) \leq$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

SECTION THIRTY SIX

pp And ppb Collisions

INTRODUCTION—VARIABLES USED

Correlation phenomena observed by CMS may shed light on exotic state of matter Julia Velkovska and Wei Li 2013-05-31 (Figures and a few paragraphs are deleted attributable to spatial constraints)

(1) The "ridge" was first observed in nucleus-nucleus collisions at the Relativistic Heavy Ion Collider and has a long history of competing theoretical explanations. Presently it is understood **to be the(e) consequence** of the explosion of a "droplet" of quark-gluon plasma (QGP) in which thousands of particles "flow" in a correlated fashion almost without any internal friction.

(2) However, a ridge was also observed in proton-proton (pp) and proton-nucleus collisions, where a QGP-like matter was not expected to be formed. In systems like pp and pPb the initial collision zone is about an order of magnitude **smaller (eb) in size** than in the lead-lead (PbPb) system and it is therefore difficult to reach a high-enough energy density **required (e) to** melt colliding nucleons into a soup of quarks and gluons.

(3) Yet, in rare cases, when the pp and pPb collisions **produce** a huge number of particles, these particles appear to be correlated.

(4) The question is, do these correlations in pp and pPb collisions share a common physical origin as in PbPb interactions, **are they(e) caused by** the internal gluon structure of the protons (as proposed by the "colour-glass condensate" model), or perhaps are they caused by both?. We assume the proposition and give a model

(5) In the 2013 run, on some occasions as many as 420 charged particles were observed **coming (e) out of a** single pPb collision in the CMS detector (see Image 1 for an event display of such a collision).

(6) This recorded data sample contained a relatively few, extraordinary cases where the multiplicity of particles produced is **comparable (=) to that** in an average PbPb collision.

(7) And sure enough, the two-particle correlations also look very similar. Image 2 shows a direct comparison of two-particle correlations between PbPb and pPb collisions **by (e&eb) selecting the** same particle-multiplicity ranges.(figure deleted due to spatial constraints. Please see paper)

(8) The new data set also makes it possible to analyse the long-range correlations in greater detail. A technique similar to the approach used to study the cosmic microwave background (CMB) spectrum was deployed to investigate the correlations.

(9) For the CMB data analysis, microscopic temperature fluctuations reveal the primordial inhomogeneity in the Universe immediately after the big bang, which eventually **gave rise to** galaxies.

(10) In each lead-lead collision a different microcosm **is produced** with its own set of

fluctuations of hot spots in the collision zone that then propagate as ripples which can be uncovered by the CMS detector.

$$G_{13}^{(2)}\left|(a''_{13})^{(1)}\left(T_{14}^{(1)},s_{(13)}\right)-(a''_{13})^{(1)}\left(T_{14}^{(2)},s_{(13)}\right)\right|\ e^{-(\widehat{M}_{13})^{(1)}s_{(13)}}e^{(\widehat{M}_{13})^{(1)}s_{(13)}}\}ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,\mathrm{t}]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \quad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\hat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on

$G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 19 to 24 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i\,(t) \geq T_i^0 e^{\left(-(b_i')^{(1)} t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2 / (a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If $G_{13}\ \ is$ bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$. The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t), t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}\,(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}$, $\frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1$ and to choose 190

$(\hat{P}_{16})^{(2)}\ and\ (\hat{Q}_{16})^{(2)}$ large to have

$$\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}\left[(\widehat{P}_{16})^{(2)}+\left((\hat{P}_{16})^{(2)}+G_j^0\right)e^{-\left(\frac{(\hat{P}_{16})^{(2)}+G_j^0}{G_j^0}\right)}\right]\leq(\hat{P}_{16})^{(2)} \quad 191$$

$$\frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}\left[\left((\hat{Q}_{16})^{(2)}+T_j^0\right)e^{-\left(\frac{(\hat{Q}_{16})^{(2)}+T_j^0}{T_j^0}\right)}+(\hat{Q}_{16})^{(2)}\right]\leq(\hat{Q}_{16})^{(2)} \quad 192$$

Remark 6: The fact that we supposed $(a''_{16})^{(2)}$ and $(b''_{16})^{(2)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{16})^{(2)}e^{(\widehat{M}_{16})^{(2)}t}$ and $(\widehat{Q}_{16})^{(2)}e^{(\widehat{M}_{16})^{(2)}t}$ respectively of $\mathbb{R}_+$. 199

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(2)}$ and $(b_i'')^{(2)}, i=16,17,18$ depend only on T_{17} and respectively on

(G_{19})(and not on t) and hypothesis can replaced by a usual Lipschitz condition.

Remark 7: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 200

it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(2)} - (a_i'')^{(2)}(T_{17}(s_{(16)}), s_{(16)})\} ds_{(16)}\right]} \geq 0$$

Then $\frac{dT_{17}}{dt} \geq (a_{17})^{(2)}(m)^{(2)} - \varepsilon_2 T_{17}$ which leads to 204

$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{\varepsilon_2}\right)(1 - e^{-\varepsilon_2 t}) + T_{17}^0 e^{-\varepsilon_2 t}$ If we take t such that $e^{-\varepsilon_2 t} = \frac{1}{2}$ it results

$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{2}\right)$, $t = \log\frac{2}{\varepsilon_2}$ By taking now ε_2 sufficiently small one sees that T_{17} is unbounded. 205
The same property holds for T_{18} if $\lim_{t\to\infty}(b_{18}'')^{(2)}\left((G_{19})(t), t\right) = (b_{18}')^{(2)}$

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{\varepsilon_8}\right)(1 - e^{-\varepsilon_8 t}) + T_{41}^0 e^{-\varepsilon_8 t}$ If we take t such that $e^{-\varepsilon_8 t} = \frac{1}{2}$ it results

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{2}\right)$, $t = log\frac{2}{\varepsilon_8}$ By taking now ε_8 sufficiently small one sees that T_{41} is unbounded.
The same property holds for T_{42} if $\lim_{t\to\infty}(b''_{42})^{(8)}\left((G_{43})(t), t(t), t\right) = (b'_{42})^{(8)}$

It is now sufficient to take $\frac{(a_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}$, $\frac{(b_i)^{(9)}}{(\widehat{M}_{44})^{(9)}} < 1$ and to choose $(\widehat{P}_{44})^{(9)}$ and $(\widehat{Q}_{44})^{(9)}$ large to have

$$\frac{(a_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}\left[(\widehat{P}_{44})^{(9)} + \left((\widehat{P}_{44})^{(9)} + G_j^0\right)e^{-\left(\frac{(\widehat{P}_{44})^{(9)}+G_j^0}{G_j^0}\right)}\right] \leq (\widehat{P}_{44})^{(9)}$$

$$\frac{(b_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}\left[\left((\widehat{Q}_{44})^{(9)} + T_j^0\right)e^{-\left(\frac{(\widehat{Q}_{44})^{(9)}+T_j^0}{T_j^0}\right)} + (\widehat{Q}_{44})^{(9)}\right] \leq (\widehat{Q}_{44})^{(9)}$$

In order that the operator $\mathcal{A}^{(9)}$ transforms the space of sextuples of functions G_i , T_i satisfying 39,35,36 into itself
The operator $\mathcal{A}^{(9)}$ is a contraction with respect to the metric

$$d\left(((G_{47})^{(1)}, (T_{47})^{(1)}), ((G_{47})^{(2)}, (T_{47})^{(2)})\right) =$$
$$\sup_i\{\max_{t\in\mathbb{R}_+}\left|G_i^{(1)}(t) - G_i^{(2)}(t)\right|e^{-(\widehat{M}_{44})^{(9)}t}, \max_{t\in\mathbb{R}_+}\left|T_i^{(1)}(t) - T_i^{(2)}(t)\right|e^{-(\widehat{M}_{44})^{(9)}t}\}$$

Indeed if we denote

Definition of $(\widetilde{G_{47}}), (\widetilde{T_{47}}) : \left((\widetilde{G_{47}}), (\widetilde{T_{47}})\right) = \mathcal{A}^{(9)}\left((G_{47}), (T_{47})\right)$
It results

$$\left|\tilde{G}_{44}^{(1)} - \tilde{G}_i^{(2)}\right| \leq \int_0^t (a_{44})^{(9)}\left|G_{45}^{(1)} - G_{45}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\,ds_{(44)} +$$
$$\int_0^t\{(a'_{44})^{(9)}\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{-(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right)\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right) - (a''_{44})^{(9)}\left(T_{45}^{(2)}, s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval [0, t]

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)} - G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t} \leq$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)}(\widehat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)}, (T_{47})^{(1)};\ (G_{47})^{(2)}, (T_{47})^{(2)})\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ *and* $(\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i = 44,45,46$ depend only on T_{45} and respectively on $(G_{47})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 99 to 44 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(9)} - (a_i'')^{(9)}(T_{45}(s_{(44)}), s_{(44)})\} ds_{(44)}\right]} \geq 0$$

$$T_i\,(t) \geq T_i^0 e^{(-(b_i')^{(9)} t)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2\ and\ \left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also $G_{45}\ and\ G_{46}$. indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a_{45}')^{(9)} G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1 / (a_{45}')^{(9)}$$

In the same way , one can obtain

$$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2 / (a_{46}')^{(9)}$$

If $G_{45}\ or\ G_{46}$ is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for $G_{45}\ and\ G_{46}$. The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t), t\right)) = (b_{45}')^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t), t\right) < \varepsilon_9, T_{44}\,(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right), \quad t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded.
The same property holds for T_{46} if $\lim_{t\to\infty}(b_{46}'')^{(9)}\left((G_{47})(t), t\right) = (b_{46}')^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

Proof : From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \le \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \le \nu^{(1)}(t) \le (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \le \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \le \nu^{(1)}(t) \le$$

$$\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \le (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \le (\bar{\nu}_1)^{(1)} \le \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)} \le \nu^{(1)}(t) \le \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \le (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(1)}(t)$:-

$$(m_2)^{(1)} \le \nu^{(1)}(t) \le (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \le u^{(1)}(t) \le (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)}G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

SECTION THIRTY SEVEN

Shor's Factoring Algorithm

INTRODUCTION—VARIABLES USED

Quantum computation and Shor's factoring algorithm Artur Ekert et al

(1) Current technology is beginning to allow us to **manipulate** rather than just observe individual quantum phenomena.
(2) This opens up the possibility of exploiting quantum effects **to (eb) perform** computations beyond the scope of any classical computer.
(3) Recently Peter Shor discovered an efficient algorithm for factoring whole numbers, **which uses** characteristically quantum effects. The algorithm illustrates the potential power of quantum computation, as there is no known efficient classical method for solving this problem. The authors give an exposition of Shor's algorithm together with an introduction to quantum computation and

complexity theory. They discuss experiments that may contribute to its practical implementation. [S0034-6861(96)00303-0]URL: http://link.aps.org/doi/10.1103/RevModPhys.68.733 DOI: 10.1103/RevModPhys.68.733

Quantum Computation over Continuous Variables Seth Lloyd et al

(4) This paper provides necessary and sufficient conditions for **constructing a** universal quantum computer over continuous variables.

(5) As an example, it is shown how a universal quantum computer for the amplitudes of the electromagnetic field might be constructed **using** simple linear devices such as beam splitters and phase shifters, together with squeezers and nonlinear devices such as Kerr-effect fibers and atoms in optical cavities.

(6) Such a device could in principle **perform** "quantum floating point" computations. Problems involving noise, finite precision, and error correction are discussed.URL: http://link.aps.org/doi/10.1103/PhysRevLett.82.1784DOI: 10.1103/PhysRevLett.82.1784

Characterization, applicability and defect analysis for tiles nanostructure of quantum dot cellular automata DOI:10.1080/08927022.2010.536543 Kunal Dasa et al

(7) Quantum dot cellular automata (QCA) are an emerging technology for nanoscale computing. In this paper, our contribution is to enhance the applicability of 3 × 3 tile nanostructure in QCA. We introduced few novel 3 × 3 active-type tiles, namely triple fan-output tiles or butterfly tile, five-input majority voter (MV) and fault-tolerant 3 × 3 tile-coupled majority–minority voter. Authors also explore the cascading effect **on (e&eb)** 3 × 3 tile.

(8) Triple fan-out tile is applicable to drive three outputs simultaneously. Five-input MV, which is another active-type tile we proposed, **is applicable for** designing five-variable or five addressing, advanced computations.

(9) In passive-type 3 × 3 tiles, they **introduce (eb)** symmetrical baseline tiles and asymmetrical fully populated fan-in tiles. QCA design was found to be having high error during fabrication of device. Authors make exhaustive simulation for analysing the defect that can occur during fabrication process.

(10) Defects such as extra cell deposition, missing cell deposition and displaced cell deposition for QCA are prone **to (eb) occur**. Fault analyses of the above-mentioned 3 × 3 tiles are performed. They also focused **on the effect** of extra dot or missing dot deposition, during the chemical synthesis phase.
