Quotes:

The Buddha first taught that what we call mind or "I" is only the five skandhas of form, feelings, perceptions, impulses, and consciousness. We never get out of the suffering world because we believe that these things are real, and that they are the real "I."

Form does not differ from emptiness; emptiness does not differ from form.

Form is emptiness, emptiness is form.

No appearing, no disappearing. No taint, no purity. No increase, no decrease.

When you attain true emptiness, there is no speech or words. The Heart Sutra de-scribes our true nature by completely describing what our true nature is not. In our original nature, nothing ever appears or disappears. There is no such thing as taint or purity, because these are merely qualities created by the thinking-mind. And in original nature there is neither increase nor decrease. Our true nature is completely still and empty. It is the universal substance of which everything else is composed. Infinite in time and space, it has none of the characteristics that apply to things we can describe with speech and words.

All dharmas are marked with emptiness.

No cognition—no attainment.

In the true experience of emptiness, there are no words and no speech, so there is also no dharma. Some actual attain-ment of what these words point to is necessary. You must attain that there is actually nothing to at-tain. Everything is already truth, exactly as it is. You are already complete.

Nirvana.

Everything is suffering, which then leads to stopping suffering, stopping birth and death. This is nirvana. There are no opposites: no coming or going, no high or low, good or bad, birth or death. So in the true experience of emptiness, you perceive that there is already no birth or death, no coming or going.

Unexcelled perfect enlightenment—Anuttara samyak sambodhi.

Anuttara samyak sambodhi is a Sanskrit phrase meaning "unexcelled perfect enlightenment." It is simply another way of saying "truth." When you see, when you hear, when you smell, when you taste, when you touch, when you think—everything, just-like-this, is the truth. Before, just at the point of nirvana, there is no cognition, and no attainment with nothing to attain. So the bodhisattva depends on Prajna Paramita, and attains nirvana. But then these three words appear: Anuttara samyak sambodhi. Before, there is no attainment; now, all buddhas attain Anuttara samyak sambodhi.

If you just attain true emptiness, this is only nirvana. It is an experience of complete stillness and bliss: there is no subject or object, no good or bad, no coming or going, no life or death. There is nothing to attain. But Mahayana means your practice continues "beyond" this point, so that you attain no-attainment. You must find nirvana's function in the world. The name for that is unexcelled perfect enlightenment. If you attain no-attainment, then you attain truth. Your mind is empty and clear like space. This means your mind is clear like a mirror: If a mountain appears before the mirror, there is only mountain; water appears, and there is only water; red comes, red; white comes, white. The sky is blue. The tree is green. A dog is barking, "Woof! Woof!" Sugar is sweet. Everything that you see, hear, smell, taste, touch, and think is the truth, just as it is. Nirvana means attaining emptiness, which has nothing to attain. Anuttara samyak sambodhi means using the experience of emptiness to attain truth.

The Maha Prajna Paramita Heart Sutra Zen Master Seung Sahn (Speaking Tree TOI Collection)

Abide with me; fast falls the eventide;

The darkness deepens; Lord with me abide.

When other helpers fail and comforts flee,

Help of the helpless, O abide with me.

Swift to its close ebbs out life's little day;

Earth's joys grow dim; its glories pass away;

Change and decay in all around I see;

O Thou who changest not, abide with me.

Hymn quoted in Sakshi's letter

If we assume that the world has no beginning in time, then up to every given moment an eternity has elapsed, and there has passed away in that world an infinite series of successive states of things. Now the infinity of a series consists in the fact that it can never be completed through successive synthesis. It thus follows that it is impossible for an infinite world-series to have passed away, and that a beginning of the world is therefore a necessary condition of the world's existence.

—Immanuel Kant, First Antinomy, of Space and Time

Modern mathematics has no great problems working with infinity, but the concept still troubles some philosophers, such as Viney who argues that it is a mistake to conclude, because philosophers have been unable to answer the problems posed by the idea of an actual infinite, expounded by Kant and others, that one should not believe in an infinite past, asserting out that both metaphysical world views, that time is finite and infinite, incur paradoxes. He invokes Charles Hartshorne's principle of least paradox (As long as the problems in one's

own position are fewer than those in the positions of others, there is no justification for capitulating to the arguments of opponents.) and points out several problems with the idea of temporal finitism

One such problem is given by Hartshorne's argument against the existence of a first moment in time

Even a beginning is a change, and all change requires something changing that does not come to exist through that same change. The beginning of the world would have to happen to something other than the world, something which as the subject of happening would be in a time that did not begin with the world.

—Charles Hartshorne, Man's Vision of God, p. 233

Another, subtler, problem is that a first moment would never appear to be a first moment. Pointing to the similar arguments given by the defenders of Creation Science, and similar arguments made by Bertrand Russell, he argues that there is a paradox that infects the view that a first moment of time existed: Because every event appears to have been caused by some previous event, any first event cannot look like a first event, and so the universe must always appear to be older than it actually is. In Hartshorne's words

A first moment of time would be an ontological lie through and through, a joke of existence upon itself.

—Charles Hartshorne, Man's Vision of God, p. 234

The question of Being aims… at ascertaining the a priori conditions not only for the possibility of the sciences which examine beings as beings of such and such a type, and, in doing so, already operate with an understanding of Being, but also for the possibility of those ontologies themselves which are prior to the ontical sciences and which provide their foundations. Basically, all ontology, no matter how rich and firmly compacted a system of categories it has as its disposal, remains blind and perverted from its ownmost aim, if it has not first adequately clarified the meaning of Being, and conceived this clarification as its fundamental task. (Being and Time 3: 31) (References to Being and Time will be given in the form of 'section: page number', where 'page number' refers to the widely used Macquarrie and Robinson English translation

Whenever ontology takes for its theme entities whose character of Being is other than that of Dasein, it has its own foundation and motivation in Dasein's own ontical structure, in which a pre-ontological understanding of Being is comprised as a definite characteristic… Therefore fundamental ontology, from which alone all other ontologies can take their rise, must be sought in the existential analytic of Dasein. (Being and Time 3: 33–4 Heidegger)

What is decisive is not to get out of the circle but to come into it the right way… In the circle is hidden a positive possibility of the most primordial kind of knowing. To be sure, we genuinely take hold of this possibility only when, in our interpretation, we have understood that our first, last and constant task is never to allow our fore-having, fore-sight and fore-conception to be presented to us by fancies and popular conceptions, but rather to make the scientific theme secure by working out these fore-structures in terms of the things themselves. **(Being and Time 32: 195 Heidegger)**

The less we just stare at the hammer-thing, and the more we seize hold of it and use it, the more primordial does our relationship to it become, and the more unveiledly is it encountered as that which it is—as equipment. The hammering itself uncovers the specific 'manipulability' of the hammer. The kind of Being which equipment possesses—in which it manifests itself in its own right—we call 'readiness-to-hand'. (Being and Time 15: 98: Heidegger)

What we 'first' hear is never noises or complexes of sounds, but the creaking wagon, the motor-cycle. We hear the column on the march, the north wind, the woodpecker tapping, the fire crackling… It requires a very artificial and complicated frame of mind to 'hear' a 'pure noise'. The fact that motor-cycles and wagons are what we proximally hear is the phenomenal evidence that in every case Dasein, as Being-in-the-world, already dwells alongside what is ready-to-hand within-the-world; it certainly does not dwell proximally alongside 'sensations'; nor would it first have to give shape to the swirl of sensations to provide a springboard from which

the subject leaps off and finally arrives at a 'world'. Dasein, as essentially understanding, is proximally alongside what is understood. (Being and Time 34: 207 Heidegger)

"The wise who knows the Self as bodiless within the bodies, as unchanging among changing things, as great and omnipresent, does never grieve". "That self cannot be gained by the Veda, or by understanding, or by much learning. He whom the Self chooses, by him the Self can be gained. The Self chooses him (his body) as his own". But he who has not first turned away from his wickedness, who is not tranquil, and subdued, or whose mind is not at rest, he can never obtain the Self (even) by knowledge.

Distrust of Intellect: Katha Upanishad 1.2.22-24

He whom the world troubles not, and who troubles not the world, who is free from the emotions of joy, wrath, and fear, is dear to Me. The man who is guileless, pure, upright, unconcerned, free from distress of mind, who renounces every enterprise and worships Me, is dear to Me. He who has neither delight nor aversion, who neither mourns nor desires, who renounces good and evil fortune, and worships Me, is dear to Me. He who is the same to friend and foe, and also in honor and dishonour, who is the same in cold and heat, pleasure and pain, who is wholly free from attachment; To whom praise and blame are equal, who is silent, content with every fortune, home-renouncing, steadfast in mind, and worships Me, that man is dear to Me.

Meekness: Bhagavad Gita 12:15-19

Would he have been less full of borrowed knowledge! Then he would have accepted inspired knowledge from his father. When, with inspiration at hand, you seek book-learning, your heart, as if inspired, loads you with reproach. Traditional knowledge, when inspiration is available, Is like making ablutions in sand when water is near. Make yourself ignorant, be submissive, and then You will obtain release from your ignorance.

Masnavi: Book 4 Story 2

Sell your cleverness and buy bewilderment; Cleverness is mere opinion, bewilderment intuition.

Masnavi Book 4 Story 2

"This life of yours which you are living is not merely a piece of this entire existence, but in a certain sense the whole; only this whole is not so constituted that it can be surveyed in one single glance. This, as we know, is what the Brahmins [wise men or priests in the Vedic tradition] express in that sacred, mystic formula which is yet really so simple and so clear; tat tvam asi, this is you. Or, again, in such words as "I am in the east and the west, I am above and below, I am this entire world."

Manduka Upanishad

God isn't about making good things happen to you, or bad things happen to you. He's all about you making choices--exercising the gift of free will. God wants you to have good things and a good life, but He won't gift wrap them for you. You have to choose the actions that lead you to that life."

— Jim Butcher

It is certainly not the least charm of a theory that it is refutable; it is precisely thereby that it attracts the more subtle minds. It seems that the hundred-times-refuted theory of the "free will" owes its persistence to this charm alone; some one is always appearing who feels himself strong enough to refute it."

— Friedrich Nietzsche

If I know better than you know what I am up to, it is only because I spend more time with myself than you do."

— Daniel C. Dennett, Freedom Evolves

"Separation without separateness, reality without rift."

Charles Williams

That (pure consciousness) is full, perfect, and complete;

This (the manifest universe of matter; of names and forms) is full, perfect, complete.

Out of completion emerged completion.

And when completion emerged from completion.

Completion remained in completion.

Because of Its subtlety, unknowable; and near and far away is That"

"And undivided, yet He exists as if divided in beings;

He is to be known as the supporter of beings;

He devours and He generates."

"No division in Consciousness is admissible at any time

As it is always one and the same.

Even the individuality of the Jiva must be known as false,

Like the delusion of a snake in a rope."

The information of the whole is contained in each part.

Pribram

Order and unity are spread throughout the universe in a way which escapes our senses. In the same way that order and organisation are spread throughout the hologram. Each part of the universe contains enough information to reconstitute the whole. The form and structure of the entire universe is enfolded within each part.

Bohm

Every hundred years or so, a unique groundbreaking Copernican class volume arises unexpectedly. From ashes long thought cold of Einstein's static universe model, for the first time technically viable alternative interpretations to all pillars of Big Bang cosmology are presented in the context of a profound new “continuous-state” cosmological paradigm able to elucidate many contemporary problems plaguing the standard model of particle physics. The cosmology provides an alternative derivation of the string/brane tension formalism derived from large-scale additional dimensions that leads to a putative unique background-independent string vacuum without requiring the Higgs mechanism or SUSY superpartners. Breakthroughs presented, arising from the broad spectrum of explanatory power, include an empirical protocol for violation of the quantum uncertainty principle that provides a viable model for the implementation of universal bulk quantum computing. Other developments naturally arising from utility of the new regime include a design for constructing de Broglie-type matter-wave projectile defense shields with far-reaching consequences.

Introduction:

CLASSIFICATION OF THE PROTAGONIST OR ANTAGONIST LAWS BASED ON THE CHARACTERSTICS AND PENCHANCE, PREDILECTION, PROCLIVITY AND PROPENSITIES OF THE SYSTEMS UNDER INVESTIGATION:

Towards the end of **classificational consummation, consolidation, corporation and concatenation** we take the characterstics of the systems, the predicational interiorities, ontological consonance and primordial exactitude, accolytish representations, functional topology, apocryphal aneurism and atrophied asseveration event at contracted points, and other parameters as the bastion and stylobate of the stratification purposes. Such totalistic entities would have easy paradigm of relational content, differentiated system of expressly oriented actions with primary focus and locus of homologues receptiveness and differentially instrumental activity, variable universalism and particularism, imperative compatibilities and structural variabilities, interactional dynamical orientation, institutionalization and internalisation of **pattern variables(Parsons**)common attitudinal orientation of constituionalisation of internalized dispositions, and a qualitative gradient of structural differentiation and ascribed particularistic solidarity abstraction or interactional dynamics, internal differentiation, structural morphology, comparative variability, normative aspect of expectational prediction, projection and prognostication. There are different superfield formalism and Curci-Ferrari type restrictions for different investigating systems. Equational realisation, consummation and concatenation and consubstantiation are of primal and cardinal and seminal importance Accolytish representation and other **parametricization** could also be taken in to consideration. There is no sacrosanct rule for this. It is to be remembered that there are many **investigatable systems** in the world and the equations these theories specify is applicable to them. Another example is about Off shell nil potency; Three Cf type conditions; 3-form Abelian theory; One Cf condition ; 1-form non abelian Theory B + B9bar) =I (CX C9bar) ; absolute anticommutivity are other properties that is found in many systems. Systemic characterstics thus play a primordial role in the development of the theory be it theoretical or empirical. So their characterstics could form the sentinel for the consubstantiation of the dis integrational purposes which is orderly In case of constants we talk about total invariants like the total **Schrõdinger function**, albeit we have reservations about Everett's syndrome, like for example Total gravity in the universe. However it is to be stated in unmistable terms that **Universal function** is not acceptable to the author, while instead one could talk of the various investigating systems with different conditionalities notwithstanding the fact that say a Non Linear Schrõdinger Equation holds good and the equality holds. The same is true in the Newtonian case of **Total gravity** extant in the world. Universal wave function calls for the conditionalities and functionalities of the investigating agencies and investigating systems so that those could also be taken in to consideration in the stratification scheme. Neutrinos or the protons are the same, but the source and the time factor and the space factor are also to be taken in to attribution and ascription and assignment. Two examples that could be cited are: Personality type refers to the psychological classification of different types of individuals. Personality types are sometimes distinguished from personality traits, **with the latter embodying** a smaller grouping of behavioral tendencies. Types are sometimes said **to involve** qualitative differences between people, whereas traits might be construed as quantitative differences According to type theories, for example, introverts and extraverts are two fundamentally different categories of people. According to trait theories, introversion and extraversion are part of a continuous dimension, with many people in the middle. Myers-Briggs Type Indicator (MBTI) assessment is a **psychometric questionnaire** designed to measure psychological preferences in how people perceive the world and make decisions. These preferences were extrapolated from the typological theories proposed by Carl Gustav Jung and first published in his 1921 book Psychological Types (English edition, 1923). Jung theorized that there are four principal psychological functions by which we experience the world: sensation, intuition, feeling, and thinking. One of these four functions is dominant most of the time. Equational satisfaction and consummation is of paramount and cardinal importance. We have studied discrete Schrodinger equations, NLSE, and Einstein Field equations on the same basis which must provide frame work for further analysis **In the case of Super symmetric Yang Mills Theory**

integrable systems could be taken in to consideration) The Coulomb branch of N = 2 **supersymmetric gauge theories** in four dimensions is described in general by an integrable Hamiltonian system in the holomorphic sense. A natural construction of such systems comes from two-dimensional gauge theory and spectral curves. Ground state at the critical value of the trapping potential two entanglement measures is another example. Notwithstanding the constant ground states the characterstics of the investigating systems form the bastion and stylobate of the situation. Starting from this point of view, we propose an integrable system relevant to the N = 2 SU (n) gauge theory with a hypermultiplet in the adjoint representation, and offer much evidence that it is correct. The model has an **S-duality group** (with the central element −1 of acting as charge conjugation); permutes the Higgs, confining, and oblique confining phases in the expected fashion. **Hegel** also argues strongly against the epistemological emphasis of modern philosophy from **Descartes through Kant**, which he describes as having to first establish the nature and criteria of knowledge prior to actually knowing anything, **because this would imply** an infinite regress, a foundationalism that Hegel maintains is self-contradictory and impossible. Rather, he maintains, we must examine actual knowing as it occurs in real knowledge processes. This is why Hegel uses the term "phenomenology". "Phenomenology" comes from the Greek word for "to appear", and the phenomenology of mind is thus the study of how consciousness or mind appears to itself. In Hegel's dynamic system, it is the study of the successive appearances of the mind to itself, because on examination each one dissolves into a later, more comprehensive and integrated form or structure of mind. We also study more exotic phases. **Supersymmetric Yang-Mills theory and integrable systems Ron Donagia, 1, Edward Wittenb, 2** Kind attention is also drawn to the Boltzmann arrow of time and Everett's many worlds different past and future. [Whitehead's philosophy] is provisionally the last great Anglo- American philosophy, just before the disciples of Wittgenstein spread their mists, their sufficiency and their terror. An event is not only 'a man is crushed': the great pyramid is an event, and its duration for an hour,30 minutes, 5 minutes ..., a passage of Nature, a view of God. What are the conditions for an event so that all is event? The event produces itself in a chaos, in a chaotic multiplicity, under the condition that a sort of sieve intervenes. A global methodology is assumed here. There is **Total energy and Total gravity**. Contextually reflexivity and context justification is most alluded coefficient here. As **Geroch puts it**: Theories consist of enormous number of ideas, arguments, hunches, vague feelings, all arranged in a configuration equivocation. It is the entire body of the material that is the "Theory'. (Written from memory: See Geroch 1978). **Dreyfus and Dreyfus** regard ceteris paribus condition as the universal restriction on rule systems. Classificational rules constitute prevent the regression of prevarication of such axiomatic predications and postulation alcovishness, and is a paradigmatic statement in the salient feature which does not disregard the cause effect definition and other scientific heuristic explanations. Such congressional enterprise is necessary for the totalistic view of the problem. Part of jurisprudence could be considered part of the law itself. Constitutive rules could be disregarded when the priority of the used rules are properly understood. Paradigms guide research even in the conspicuous absence of rules. Characterization **is at the heart of** naturalization. Stratification methodologies are much more vintage and montage than any other fait accompli mutatis mutandis desideratum. Manifest world in its entirety is a **holographic projection of information** embodied in its boundary. Here we are talking of the entire manifest world. But the information obtained is only for a piece of the world for which we have access. Nature's general Ledger is to be down loaded from Neuron DNA. Another factor that is taken in to consideration is **Lancan paradox and sense**, expression and event: proposition and the attribute of the state of affairs, individualistic denotation, institutionalized generalisation, personalized manifestation, organisational individuation, and corporate signification of the systems in general. According to Schrodinger actualization means to extend over a series of ordinary points, to be selected according to the rule of convergence, to be incarnated in a body, to become a state of body, and to be renewed locally namely particle coming back to its original position for the sake of limited new actualizations and extensions. It is in this sense that actualization is collective and individual, internal and external. Geometrical interpretation of the theory of differential equations clearly places in evidence two absolutely distinct realities: (a) there is a field of directions and (b**) topological accidents** which may suddenly crop up in it, as for example the existence of the plane of "singular points" to which no direction has been attached and there are integral curves with the form they take on in the vicinity of singularities of the field of directions…… The existence and distribution of singularities are notions relative to the field of vectors defined by the differential equation. The form of the integral curves **is relative to** the solution of this equation. The forms are assuredly complementary, since the nature of the field is defined by the form of integral curves in

its vicinity. But it is no less true that the field of vectors on one hand and integral curves on the other are two essentially distinct mathematical realities. In this connection of classificational process of the universal theory, it is necessary to recall what Kant had proved. Kant proves that sum of all possibilities excludes all but originary predicates and in this way constitute the completely determined concept of an individual being or objectification being. For only in this case, is a concept is equivalent to a thing. A thing completely determined in and through itself and known as the representation of an individual or a system under consideration. Thus the Universal Theory is **but the form of communication in thought between the cosmic consciousnesses, namely the nature's general ledger, and the finite individualities, namely the histories of** individual debits' and credits. It must therefore be entangled with the play of internationalities and pure retentions. Thus the universal theory has a totality. For example total gravity. Individual systems have characterstics for which say a Non Linear Schrodinger's equation holds, and such a consummation and consolidation of the equation **is built up on the corporation and actualization of the equations in simplistic and individual cases**. Compose is to make up; the parts that compose the whole. The notion of compossibility is thus defined as a continuum of the individual systems that are actualized in accord with the reductionist view which is held dearly in all subjects in this measurement world. In the Saussurean system, potential returns in language as the nonlocalizable excess of signifier over signified that accompanies the local realization of a conventional signifier-signified coupling. This excess is ensconced in the "vertical" dimension of the process (understood very differently than in the present context: as a "synchrony" rather than a temporal disparity, the disparity that is the empty form of time). It constitutes the immanent generative surplus from which the "horizontal" relay to the next linguistic realization is drawn ("diachrony": also different from the "horizontal" lines of encounter at issue here, in that diachrony is not essentially differentiating; the system remains the same across its realizations). An analogous surplus figures in Lévi-Strauss's anthropology as "mana" and its structural equivalents, which constitute the specifically cultural presentation of the staying power of processual remainder (the reserve of potential) in many societies. It is in excess-as-remainder that a reconciling of Deleuze and Guattari's thought and **structuralisms of signification might be found ("mana" converts into Deleuze's "dark precursor" or "object = x"; 1979, 315-324; 1990, 113-115; 1994, 119-123). The deleuzo-guattarian conversion of structuralism entails the signifier and signified generating an excess by escaping down a "line of flight" away from the "despotism" (self-sameness across its variations) of the signifying regime--rather than the excess regenerating signifier-signified following the chain of conventional linguistic realizations**. This amounts to an autonomization of signified-signifier coupling as a pure, "postsignifying" form in which the matter of content melds with the manner of expression. It is the melding that takes the lead, as an "abstract machine" of autonomized, depersonalized expression (Deleuze/Guattari 1986, 3-8; Deleuze/Guattari 1987, 129-135, 189-191; Haghighi. The triad thesis, antithesis, synthesis is often used to describe the thought of German philosopher Georg Wilhelm Friedrich Hegel. Hegel never used the term himself, and almost all of his biographers have been eager to discredit it. The triad is usually described in the following way: The **thesis** is an intellectual proposition. The **antithesis is simply** the negation of the thesis, a reaction to the proposition. The synthesis solves the conflict between the thesis and antithesis by reconciling their common truths and forming a new thesis, starting the process over. According to Walter Kaufmann, **although the triad is often thought to form part of an analysis of historical and philosophical progress called the Hegelian dialectic**, the assumption is erroneous. Hegel used this classification only once, and he attributed the terminology **to Immanuel Kant**. The terminology was largely developed earlier by the neo-Kantian Johann Gottlieb Fichte, also an advocate of the philosophy identified as German idealism. The triad thesis, antithesis, synthesis is often used to describe the thought of German philosopher Georg Wilhelm Friedrich Hegel. Hegel stresses the paradoxical nature of consciousness; he knows that the mind **wants to know** the whole truth, but that it cannot think **without drawing a** distinction. Unfortunately, every distinction has two terms, every argument has a counter-argument, and consciousness **can only focus on one of these at a time**. So it fixes first on the one, then under pressure fixes second on the other, until it finally comes to rest on the distinction itself. Hegel refers to this **process of alternation and rest as dialectic**. In other words, the dialectical method **involves the** notion that the form of historical movement, process or progress, **is the result of** conflicting opposites. Thus this area of Hegel's thought **has been broken down in terms** of the categories of thesis, antithesis, and synthesis. Hegel's philosophy of history embraces the concept that a conflict of opposites is a struggle between actual and potential worlds. Kant's first Critique concerns itself with determining the structure of the objects of experience. His transcendental logic allows **an**

empirical manifold, or multiplicity, to be grasped as a unified object, but only insofar as its unity is provided by the subject (via apperception). The transcendental ego synthesizes manifolds that remain distinct in kind from it, and thus its logic can only provide the a priori conditions for possible experiences, not the generative conditions for actual ones. "Kant's main preoccupation is therefore with the validity of propositions given in advance of our enquiry", for it merely seeks the conditions for subjective knowledge of an object, which are presumed to be identical with the conditions of objects themselves. Limited to schematic overviews, brief asides or even dismissive caricatures these philosophies muster enough strength stride by stride with present day theories(Henry Somers-Hall, Hegel, Deleuze, and the Critique of Representation: **Dialectics of Negation and Difference, State University of New York Press, 2012, 289pp., (hbk), ISBN 9781438440095. Reviewed by Jim Vernon, York University)** Hegel shows how the various categories of logic sublate each other, turning contradiction into the motor that drives, rather than the problematic limit that haunts, representational thinking. The extended physical and biological theory is not just a multidimensional consciousness theory, but it is, after and above all, a philosophical theory. But their connection is not hierarchical. The self-created structural and structure less system of the multi-theoretical components is necessarily (in reality and symbolically also, a multi-centred, in- and out- infinitely expanded, multi-layered spherical) logical and logical spacetime theory. But to fully unfold this concept, neither physics, nor any other partial theory is capable in itself. So, the different unified theories together are cannot be other than the wholeness theory, the unified top theory or the philosophical metatheory, but is this not just to give a name, to explain something, would this be the Creation/Non-creation itself? **On Quantum's Universality: Posted on 5/19/2004 by Dave Bacon (The Quantum Pontiff):** Often when I am thinking about the foundations of quantum theory, I am struck by the universality of the theory. Quantum theory (or its related cousin, quantum field theory) applies generically to all physical systems (disregarding the transition to some "classical" theory and of course, difficulties with both QCD and gravity.) Thus we apply quantum theory to our basic theories of physics, electromagnetism, the weak force, the strong force, but we also apply quantum theory to simple atoms and complex molecules, to single electrons and electron gases in metals, etc. Quantum theory is the universal language we use to describe any physical process. If we are thinking about ways to explain quantum theory, then this universality is a bit mysterious: the explanation had better apply to all of these different physical systems and that seems like a lot of work! Of course, this reasoning is flawed: it seems the universality is an illusion. The reason we can describe a complex molecule by quantum theory is that the fundamental constituents of that molecule obey quantum theory. Separation of different energy scales (and other scales, like localibility) allow us to ignore some of the constituents details, and the complex system behaves like a quantum system. So really any explanation of quantum theory need only apply to some basic level of physics (where this level is I refuse to speculate.) While quantum theory appears mysteriously universal, this is an illusion for those persuing understanding the mystery of the quantum. Whitehead was a mathematician as well as philosopher. Metaphysics was his main interest. He said it is the task of philosophy "to frame a coherent, logical, necessary system of general ideas in terms of which every element of our experience can be interpreted

The triad is often said to have been extended and adopted by Karl Marx and Friedrich Engels, however, Marx referred to them in The Poverty of Philosophy as speaking Greek and "Wooden trichotomies" .The classic empiricist presentation of this approach is William James's Essays in Radical Empiricism: "There is no general stuff of which appearance is made. It is made of that, or just what appears (26-27) ... what I call **'pure experience' [is] only virtually or potentially either object or subject as yet.** For the time being, it is plain, unqualified actuality, a simple that (23) ... experience as a whole is self-containing and leans on nothing (193) ... **object and subject fuse in the fact of 'presentation' or sense-perception (197) ... knower and object exist as so many ultimate thats or facts of being**" (196). As the last phrase suggests, James's "that" (or "this-that": to signal a differential, or incipient difference) is Francis Bacon's "fact," which can in turn be understood in terms of Whitehead's definition of fact as the "undifferentiated terminus of sense-awareness," the inexhaustible unthought from which thought "diversifies" and to which it "demonstratively" returns, as to its "ideal limit" (6-10, 13-15. **On the "univocity" of the coming to expression of the multiple, see Deleuze 1990, 177-180; 1994, 35-42, 303-304.** Can the nature of thinking be uncovered by thinking alone? (Cf consciousness) "My dialectical method is, in its foundations, not only different from the Hegelian, but exactly opposite to it. For Hegel, the process of thinking, which he even transforms into an independent subject, under the name of 'the idea ', is the creator of the real world, and the real world is only the external appearance of the idea. With me,

the reverse is true: the ideal is nothing but the material world reflected in the mind of man, and translated into forms of thought. "Karl Marx, Capital, vol. 1, Preface to the Second Edition. (P.102) (See Ideal / Real) For Aristotle, Thinking is the one specific activity of the Human Soul Which is Capable of Independent Existence and separate from any connection to the Body. A Strenuous counterargument has been made, precisely for body thinking. Deleuze and Guattari for, "Becoming Animal" and "Becoming intense" are Modes of resistance to abstract Thinking. Alain Badiou FOLLOWS Aristotle in using thinking **to define** specifically the Human, as Opposed to Interest. For Badiou, "the capacity which is specifically human is that of thought, and thought is nothing other than that by which the path of a truth seizes and traverses the human animal." **(Infinite Thought, p. 71)** In HIS Essay "Does Consciousness Exist?" **William James** Pointed out That Consciousness is a Process, and not a substance. (Unlike Descartes, who claimed the existence of a res cogitans?) In The Principles of Psychology, **James described five properties of what he called "thought**." Every thought, he wrote, tends to be **part of personal consciousness**. We write this despite the definition that has been held for the consciousness as a storage room and mind anagrammatically acting upon it. Concomitant quantum channeling like synapses and neuron firing might take place the in the brain. And that falls under the subterranean realm and ceratoid dualism of Neurology. Thought is always changing, is sensibly continuous, and appears to deal with objects independent of it. In addition, thought focuses on some objects to the exclusion of others. In other words, it involves attention. Alfred North Whitehead claimed that, with this Inquiry, James was to the Twentieth century What Descartes was to the Seventeenth. Louis Sullivan describes "Real Thinking," Thinking in the present tense, as Organic Thought. "It is in the present, only, that you really live, therefore it is in the present, only that you can really think. And in this sense you think organically. Pseudo-thinking is inorganic. The one is living, the other dead. The present is the organic moment, the living moment. "(Kindergarten Chats, "Thought.") **Thinking is a form of Computation? Emergence ---------- Emergence Refers to the appearance of Patterns of Organization and is one of the Key concepts of Complexity and a -life. It is sometimes referred to as a situation where the whole is greater than** the sum of the parts, because it cannot be analyzed by taking the parts apart and examining them separately. One reason for this is that in a complex phenomenon **showing** emergent properties, the parts become a determining context for each other, and these patterns of feedback **contribute to the** appearance of the emergent phenomenon. For Michael Polanyi, "**Evolution can be understood only as a feat of emergence**." For Goethe, the Whole Living was Also More than the Sum of ITS parts. "Das ist zwar Lebendige in Elemente zerlegt, aber MAN Kann ES aus Diesen nicht wieder zusammenstellen und beleben." Goethe quoted in d'Arcy Thompson, **On Growth and Form. (P.41)** But for most contemporary scientists, Goethe's meaning of emergence was a mystical one. For Francis Crick, the scientific meaning of emergent assumes that while the **whole cannot be the simple sum of the separate parts, its behavior can, at least in principle, be understood from the nature and behavior of its parts plus the knowledge of how all these parts interact. (The Astonishing Hypothesis, P.11)** (Assuming IT's Possible to have **That Laplacian Knowledge**) Stuart Kauffman Suggests That many Properties of Organisms May be Probable **emergent Collective Properties** of Their constituents. (This is precisely Kant's definition of the organic - as the result of internal interactions instead of an assembly of preexisting parts. (See Mechanism / Vitalism) "The problem of origins requires an understanding of how new levels of order emerge from complex patterns of interactions and what the properties of these emergent structures are in terms of their robustness to perturbation and their capacities for self-maintenance **"(Brian Goodwin, How the Leopard Changed its Spots, p. 181.)** Luc Steels Offers Useful definitions of emergence in Artificial Life half. He distinguishes between first order emergence, defined as a property not explicitly programmed in, and second-order emergence, defined as an emergent behavior that adds additional functionality in the system. In general a-life researchers try to create second -order emergence, then the system for use CANS ITS own emergent Properties to create an upward Spiral of Continuing evolution and emergent behaviors. For a Critique of emergence, See Peter Cariani, "Emergence and adaptivity in Organisms and Devices," World Fudtures 32 (1991):111-32. C. Lloyd Morgan's Descriptions of emergence as a Qualitative Change in direction closely resemble the definitions of bifurcations. HIS In Emergent Evolution, of 1923, he writes, "**The emergent step, although it may seem more or less saltatory, is best Regarded as a Qualitative Change of direction, or Critical turning-Point, in the Course of events**. " Daniel Stern describes the Infant's sense of Self between Birth and two months as the "emergent Self." (See subject). It is a sense of the Coming-into-Being of Organization and Remains active for the rest of life. But IT is not an overarching schema About Integrating the Self, but rather an Experience of

Process. (cf Molar / Molecular) In Gestalt Perception terms, emergence refers to our ability to perceive forms that cannot be reduced to the addition of the "atomic" parts of a pattern. Ego superimposing two squares diagonally displaced **allows for** readings of an emergent square at their overlap, two emergent L-shapes in the non-Intersecting area, in addition to the two Squares. (cf. Figure / Ground) A **Fundamental property of Open Systems is that they stabilize any improbability which Serves to elicit them**. Being / Becoming --------- ---------- According to Ernst Cassirer, Plato's Philosophy recognizes two Contrary Forms of representation, one of Which is Valid for the Realm of Being and the Other for the Realm of Becoming. (Individual and Cosmos, p.125) For Cassirer, "**Form Thinking**" Belongs to Being, while "causal Thinking" Belongs to Becoming. But strict Knowledge is Only Possible of the Always-Being. Becoming that which is CAN only be described, if at All, in the language of myth. Or rather, myth is already familiar with both the question of the "what" and the question of the "whence." "It sees everything that it grasps (the world as well as the gods) under this double aspect."(The Problem of Form and the Problem of Cause, in The Logic of the Cultural Sciences, p. 87) Socrates first Discovered the Concept, or Eidos as the relation Between the Particular and the General and as a germ of a new meaning of the general question concerning being. This meaning emerged in its full purity when the Socratic eidos went on to unfold into the (transcendental) Platonic "Idea." (See transcendence / immanence) For Plato, the soul is an intermediary between being and Becoming. The Aristotelian system seemed to Promise a Different reconciliation of the Opposition between Being and Becoming. Unlike Plato and the thinkers of pure form, Aristotle wanted to restore to Becoming ITS rightful Place, Because He was convinced **That Only in this way Could Philosophy be Transformed from a Mere Theory of concepts into a Theory of Reality. Form and Matter, Being and Becoming, must become correlative. Peculiarly Aristotelian the Concept of the formal Cause originates from this fusion**. (Cassirer) "In Nature We May Search for successfully something that endures, and in nature we may regard becoming as if any phase of it were the "reason" of a later phase and the "consequence" of an earlier one. We may even go so far as to say: Nature is the one mediate object that obeys the postulates of the rational theory of becoming. "Hans Driesch, History and Theory of Vitalism, p. 193. One might compare Hegel's point here to that expressed by Kant in his well known claim that without concepts, those singular and immediate mental representations he calls “intuitions” are “blind.” In more recent terminology one might talk of the “concept-” or “theory-ladenness” of all experience, and the lessons of this chapter have been likened to that of Wilfred Sellars's famous criticism of the “myth of the given” (Sellars 1997). Hegel has insisted on quarantining his defensible ideas from it (e.g., Wood 1990). However, rather than be understood as a treatise in formal (or “general”) logic, it is perhaps best understood as a version of what Kant had called “transcendental logic,” and in this sense thought of as a successor to Kant's “transcendental deduction of the categories” in the Critique of Pure Reason in which Kant attempted to “deduce” a list of those non-empirical concepts, the “categories,” which he believed to be presupposed by all empirical judgments made by finite, discursive thinkers. However, whereas the latter’s is largely etymologically oriented and given to exploiting semantic ambiguities, traces and aporias, Deleuze’s strategy is more geared towards conceptual and functional differentiation, exploring the horizons of Ideas (in the Kantian sense) and bringingforth the machinic and operative features of the philosophies with which he engages. hile, for Lacan, Truth is this shattering experience of the Void - a sudden insight into the abyss of Being, "not a process so much as a brief traumatic encounter, or illuminating shock, in the midst of common reality" -, for Badiou, Truth is what comes afterward: the long arduous work of fidelity, of enforcing a new law onto the situation. 5 The choice is thus: "whether a vanishing apparition of the real as absent cause (for Lacan) or a forceful transformation of the real into a consistent truth. doctrine is precisely that, while never ceasing to be dialectical in pinpointing the absent cause and its divisive effects on the whole, it nevertheless remains tied to this whole itself and is thus unable to account for the latter's possible transformation. /.../ Surely anchored in the real as a lack of being, a truth procedure is that which gives being to this very lack. Pinpointing the absent cause or constitutive outside of a situation, in other words, remains a dialectical yet idealist tactic, unless this evanescent point of the real is forced, distorted, and extended, in order to give consistency to the real as a new generic truth. Bosteels describes the modality of the truth-procedure: Setting out from the void which prior to the event remains indiscernible in

the language of established knowledge, a subjective intervention **names** the event which disappears no sooner than it appears; /it/ faithfully connects as many elements of the situation as possible to this name which is the only trace of the vanished event, and **subsequently forces** the extended situation from the bias of the new truth as if the latter were indeed already generally applicable. Bosteels basic reproach, according to which, psychoanalysis collapses into an instantaneous act what is in reality an ongoing and impure procedure, which from a singular event leads to a generic truth by way of a forced return upon the initial situation. Whereas for Zizek, the empty place of the real that is impossible to symbolize is somehow already the act of truth itself, for Badiou a truth comes about only by forcing the real and by displacing the empty place, so as to make the impossible possible. 'Every truth is post-evental,' Badiou writes. An example is Descartes' celebrated phrase at the beginning of the Discourse on the Method: Good sense is the most evenly shared thing in the world. . the capacity to judge correctly and to distinguish the true from the false, which is properly what one calls common sense or reason, is naturally equal in all men . . For Deleuze, is an image of thought? Although images of thought take the common form of an 'Everybody knows . . .' (DR 130), they are not essentially conscious. Rather, they operate on the level of the social and the unconscious, and function, "all the more effectively in silence." (DR 167). Relationship of philosophy to thought must have two correlative aspects, Deleuze argues: an attack on the traditional moral image of thought, but also a movement towards understanding thought as self-engendering, an act of creation, not just of what is thought, but of thought itself, within thought (DR 147). he thought which is born in thought, the act of thinking which is neither given by innateness nor presupposed by reminiscence but engendered in its genitality, is a thought without image. But what is such a thought, and how does it operate in the world? (DR 167; cf. 132) Durkheim's concepts of the collective representation and the process of universalization, then, **correspond to** Kantian concepts, and Durkheim acknowledges the relevance of Kantian philosophy to his epistemological and moral considerations (1965: 494). It is to be noted and stated in unmistakable and unequivocal words that the singularities and the events constitute a life coexist with the accidents of life that corresponds to it, but they are neither grouped nor divided in the same way. They connect in a manner entirely different from how individuals connect by virtue of which classification takes place. A singular life might do without any individuality, without any other concomitant that individualizes it. Individual life or that of insentient life remains inseparable from empirical determinations. On the other hand, the indefinite as such is the mark of not an empirical indetermination but of a determination by immanence or a transcendental determinability. (**Pure Immanence Gilles Deluze: Page number 30).** It is to be realized that a phenomenon which we think out is engaged in process of actualization following the plane that gives it its particular reality. Plane of immanence therefore is actualization, as long as the events that populate them are localised by a law or other theorem tic corollary.

Deleuze uses the introduction to clarify the term "repetition." Deleuze's repetition can be understood by contrasting it to generality. Both words describe events that have some underlying connections. Generality refers to events that are connected through cycles, equalities, and laws. Most phenomena that can be directly described by science are generalities. Seemingly isolated events will occur in the same way over and over again because they are governed by the same laws. Water will flow downhill and sunlight will create warmth because of principles that apply broadly. In the human realm, behavior that accords with norms and laws counts as generality for similar reasons. Science deals mostly with generalities because it seeks to predict reality using reduction and equivalence. Repetition, for Deleuze, can only describe a unique series of things or events. The Borges story in which Pierre Menard reproduces the exact text of Don Quixote is a quintessential repetition: the repetition of Cervantes in Menard takes on a magical quality by virtue of its translation into a different time and place. Art is often a source of repetition because no artistic use of an element is ever truly equivalent to other uses. (Pop Art pushes this quality to a certain limit by bringing production near the level of capitalism.) For humans, repetition is inherently Transgressive. As in Coldness and Cruelty, Deleuze identifies humor and irony as lines of escape from the generalities of society. Humor and irony are in league with repetition because they create distance from laws and norms even while re-enacting them. Deleuze describes repetition as a shared value of an otherwise rather disparate trio: Kierkegaard, Nietzsche, and Péguy. He also connects the idea to Freud's death drive. He goes on to define repetition as "difference without a concept" . Repetition is thus reliant on difference more deeply than it is opposed. Further, profound repetition will be characterized by profound difference.

Difference in Itself

Deleuze paints a picture of philosophical history in which difference has long been subordinated to four pillars of reason: identity, opposition, analogy, and resemblance. He argues that difference has been treated as a secondary characteristic which emerges when one compares pre-existing things; these things can then be said to have differences. This network of direct relations between identities roughly overlays a much more subtle and involuted network of real differences: gradients, intensities, overlaps, and so forth .The chapter contains a discussion of how various philosophers have treated the emergence of difference within Being. This section uses Duns Scotus, Spinoza, and others to make the case that "there has only ever been one ontological proposition: Being is univocal. ... A single voice raises the clamor of being" . One then tries to understand the nature of differences that arise within Being. Deleuze describes how Hegel took contradiction—pure opposition—to be the principle underlying all difference and consequently to be the explanatory principle of the entire world's texture. He accuses this conception of having a theological and metaphysical slant.

Deleuze proposes (citing Leibniz) that difference is better understood through the use of dx, the differential. A derivative, dy/dx, determines the structure of a curve while nonetheless existing just outside the curve itself; that is, by describing a virtual tangent. Deleuze argues that difference should fundamentally be the object of affirmation and not negation. As per Nietzsche, negation becomes secondary and epiphenomenal in relation to this primary force.. Repetition for Itself: The chapter describes three different levels of time within which repetition occurs. Deleuze takes as axiomatic the notion that there is no time but the present, which contains past and future. These layers describe different ways in which past and future can be inscribed in a present. As this inscription grows more complicated, the status of the present itself becomes more abstract. Basic processes of the universe have a momentum that they carry into each present moment. A 'contraction' of reality refers to the collection of a diffuse ongoing force into the present. Prior thought and behavior, all substance performs contraction. "We are made of contracted water, earth, light, and air...Every organism, in its receptive and perceptual elements, but also in its viscera, is a sum of contractions, of retentions and expectations. Passive synthesis is exemplified by habit. Habit incarnates the past (and gestures to the future) in the present by transforming the weight of experience into an urgency. Habit creates a multitude of "larval selves," each of which functions like a small ego with desires and satisfactions. In Freudian discourse, this is the domain of bound excitations associated with the pleasure principle. Deleuze cites Hume and Bergson as relevant to his understanding of the passive synthesis. Active synthesis: The second level of time is organized by the active force of memory, which introduces discontinuity into the passage of time by sustaining relationships between more distant events. A discussion of destiny makes clear how memory transforms time and enacts a more profound form of repetition: Destiny never consists in step-by-step deterministic relations between presents which succeed one another according to the order of a represented time. Rather, it implies between successive presents non-localisable connections, actions at a distance, systems of replay, resonance and echoes, objective chances, signs, signals, and roles which transcend spatial locations and temporal successions. Relative to the passive synthesis of habit, memory is virtual and vertical. It deals with events in their depth and structure rather than in their contiguity in time. Where passive syntheses created a field of 'me's,' active synthesis is performed by 'I.' In the Freudian register, this synthesis describes the displaced energy of Eros, which becomes a searching and problematizing force rather than a simple stimulus to gratification.

Empty time

The third layer of time still exists in the present, but it does so in a way that breaks free from the simple repetition of time. This level refers to an ultimate event so powerful that it becomes omnipresent. It is a great symbolic event, like the murder to be committed by Oedipus or Hamlet. Upon rising to this level, an actor effaces herself as such and joins the abstract realm of eternal return. The me and the I give way to "the man without name, without family, without qualities, without self or I...the already-Overman whose scattered members gravitate around the sublime image" Empty time is associated with Thanatos, a desexualized energy that runs through all matter and supersedes the particularity of an individual psychic system. Deleuze is careful to point out that there is no reason for Thanatos to(eb) produce a specifically destructive impulse or 'death instinct' in the subject; he conceives of Thanatos as simply indifferent.

The Image of Thought

This chapter takes aim at an "image of thought" that permeates both popular and philosophical discourse. According to this image, thinking naturally gravitates towards truth. Thought is divided easily into categories of truth and error. The model for thought comes from the educational institution, in which a master sets a problem and the pupil produces a solution which is either true or false. This image of the subject supposes that there are different faculties, each of which ideally grasps the particular domain of reality to which it is most suited. In philosophy, this conception results in discourses predicated on the argument that "Everybody knows..." the truth of some basic idea. Descartes, for example, appeals to the idea that everyone can at least think and therefore exists. Deleuze points out that philosophy of this type attempts to eliminate all objective presuppositions while maintaining subjective ones. Deleuze maintains, with Artaud, that real thinking is one of the most difficult challenges there is. Thinking requires a confrontation with stupidity, the state of being formlessly human without engaging any real problems. One discovers that the real path to truth is through the production of sense: the creation of a texture for thought that relates it to its object. Sense is the membrane that relates thought to its other. Accordingly, learning is not the memorization of facts but the coordination of thought with a reality. "As a result, 'learning' always takes place in and through the unconscious, thereby establishing the bond of a profound complicity between nature and mind". Deleuze's alternate image of thought is based on difference, which creates a dynamism that traverses individual faculties and conceptions. This thought is fundamentally energetic and asignifying: if it produces propositions, these are wholly secondary to its development.

At the end of the chapter, Deleuze sums up the image of thought he critiques with eight attributes: the postulate of the principle, or the Cogitatio natural universalis (good will of the thinker and good nature of thought); the postulate of the ideal, or common sense (common sense as the concordia facultatum and good sense as the distribution which guarantees this concord); the postulate of the model, or of recognition (recognition inviting all the faculties to exercise themselves upon an object supposedly the same, and the consequent possibility of error in the distribution when one faculty confuses one of its objects with a different object of another faculty); the postulate of the element or of representation (when difference is subordinated to the complimentary dimensions of the Same and the Similar, the Analogous and the Opposed; the postulate of the negative, or of error (in which error expresses everything which can go wrong in thought, but only as the product of external mechanisms); the postulate of logical function, or the proposition (designation is taken to be the locus of truth, sense being no more than the neutralized double or the infinite doubling of the proposition); the postulate of modality, or solutions (problems being materially traced from propositions or indeed, formally defined by the possibility of their being solved); the postulate of the end, or result, the postulate of knowledge (the subordination of learning to knowledge, and of culture to method.

It is to be stated that we are here reproducing the following for the bastion and stylobatishness of the necessity of classificational procedural formalities and I donot believe in whatever that has been stated. Nor is it meant as propaganda. It is purely definitional with axiomatic predications and doctrinal manifestations. In Vedas and Upanishads the classification processual formalities of Universal action is undertaken thus with a mention that the proportion of the ones mentioned would be different in different individuals and individuals themselves are investigating systems notwithstanding a wider classification which is nothing but more than a Universal Law. Manduka Upanishad divides all knowledge into two categories. The knowledge that leads to Self Realization is called Para Vidya (Great or Divine Knowledge) and everything else is called Apara Vidya or Knowledge of Material world (wordly knowledge). Shaunaka approaches sage Angiras and asks "Revered Sir, by knowing what everything will be known?" Angiras replies that two know ledges should be known, one is **Para Vidya** and other is **Apara Vidya.** Knowledge of worldly things is Apara Vidya and that by which Eternal Truth or Akshara is obtained is Para Vidya. Though Apara Vidya enables one to earn ones bread and helps one to understand each object of universe separately, it does not show the Ultimate Reality (Akshara) or Root Cause of this universe. While Para Vidya doesn't teach objects of this universe but enables one to understand underlying fabric of it. Like by knowing gold all the gold ornaments could be known, by knowing Akshara, it's another manifestation, the universe is known. This Upanishad expounds the greatness of Para. To think whether a certain thing may be eaten is a thought-form of the mind; "It is good. It is not good. It can be eaten. It cannot be eaten", discriminating notions like these constitute the discriminative intellect. Because the mind alone

constitutes the root-principle manifesting as the individual, God and the world, its absorption or submergence and dissolution in the Self as pure Consciousness is the final emancipation known as Kaivalya and in the Supreme Spirit, the Brahman.(Ramana maharishi and Wikipedia). **Tamas (Darkness):** Complete delusion, ignorance, illiberality, indecision in respect of action, sleep, haughtiness, fear, cupidity, grief, censure of good acts, loss of memory, unripeness of judgment, absence of faith, violation of all rules of conduct, want of discrimination, blindness, vileness of behaviour, boastful assertions of performance when there has been no performance, presumption of knowledge in ignorance, unfriendliness (or hostility), evilness of disposition, absence of faith, stupid reasoning, crookedness, incapacity for association, sinful action, senselessness, stolidity, lassitude, absence of self-control, degradation, - all these qualities are known as belonging to Darkness **(Tamas).** Whatever other states of mind connected with delusion exist in the world, all appertain to Darkness. Frequent ill-speaking of other people, censuring the deities and the Brahmanas (priests), illiberality, vanity, delusion, wrath, unforgiveness, hostility towards all creatures, are regarded as the characteristics of Darkness. Whatever undertakings exist that are unmeritorious (in consequence of their being vain or useless), what gifts there are that are unmeritorious (in consequence of the unworthiness of the done, the unreasonableness of the time, the impropriety of the object, etc.), vain eating, - these also appertain to **Darknesss (Tamas).** Indulgence in calumny, unforgiveness, animosity, vanity, and absence of faith are also said to be characteristics of Darkness. Whatever men there are in this world who are characterised by these and other faults of a similar kind, and who break through the restraints provided by the scriptures, are all regarded as belonging to the quality of Darkness. Here Rishis and Munis (Seers and sages), and deities become deluded, desirous of pleasure. Darkness, delusion, the great delusion, the great obscurity called wrath, and death, that blinding obscurity (these are the five great afflictions). As regards wrath, that is the great obscurity (and not aversion or hatred as is sometimes included in the list). With respect then to its colour (nature), its characteristics, and its source, I have, ye learned Brahmanas, declared to you, accurately and in due order, everything about the quality of Darkness (Tamas). Who is there that truly understands it? Who is there that truly sees it? That, indeed, is the characteristic of Darkness, viz., the beholding of reality in what is not real. The qualities of Darkness have been declared to you in various ways.

Rajas (Passion): Injuring others, beauty, toil, pleasure and pain, cold and heat, lordship (or power), war, peace, arguments, dissatisfaction, endurance, might, valour, pride, wrath, exertion, quarrel, jealousy, desire, malice, battle, the sense of meum or mineness, protection of others, slaughter, bonds, and affliction, buying and selling, lopping off, cutting, piercing and cutting off the coat of mail that another has worn, fierceness, cruelty, vilifying, pointing out the faults of others, thoughts entirely devoted to worldly affairs, anxiety, animosity, reviling of others, false speech, false or vain gifts, hesitancy or doubts, boastfulness of speech, praise and criticisms, laudation, prowess, defiance, attendance (as on the weak and the sick), obedience (to the commands of preceptors and parents), service or ministrations, harbouring of thirst or desire, cleverness or dexterity of conduct, policy heedlessness, contumely, possessions, and diverse decorations that prevail in the world among men, women, animals, inanimate things, houses, grief, incredulousness, vows and regulations, actions with expectation (of good result), diverse acts of public charity, the rites in respect of Swaha salutations, rites of Swadha and Vashat, officiating at the sacrifices of others, imparting of instruction, performance of sacrifices, study, making of gifts, acceptance of gifts, rites of expiation, auspicious acts, the wish to have this and that, affection generated by the merits of the object for which or whom it is felt, treachery, deception, disrespect and respect, theft, killing, desire of concealment, vexation, wakefulness, ostentation, haughtiness, attachment, devotion, contentment, exultation, gambling, indulgence in scandal, all relations arising out of women, attachment to dancing, instrumental music and songs – all these qualities have been said to belong to the quality of Passion (Rajas). Those men on earth who meditate on the past, present and the future, who are devoted to the aggregate of the three viz., Religion, Wealth and Pleasure, who acting from impulse of desire, exult on attaining to affluence in respect of every desire, are said to be enveloped by Passion (Rajas). These men have downward courses. Repeatedly reborn in this world, they give themselves up to pleasure. They covet what belongs to the world as also all those fruits that belong to the world hereafter. They make gifts, accept gifts, offer oblations to the Pitris, and pour libations on the sacrificial fire.

Sattwa (Goodness): Brahma (the Grandsire Prajapati) said: Sattwa is beneficial to all creatures in the world, and unblamable, and constitutes the conduct of those that are good. Joy, satisfaction, nobility, enlightenment,

and happiness, absence of stinginess, absence of fear, contentment, disposition for faith, forgiveness, courage, abstention from injuring any creature, equability, truth, straightforwardness, absence of wrath, absence of malice, purity, cleverness, prowess- these appertain to the quality of Goodness (Sattwa).He who is devoted to the duty of Yoga, regarding knowledge to be vain, conduct to be vain, service to be vain, and mode of life to be vain, attains to what is highest in the world hereafter. Freedom from the idea of meum (mineness), freedom from egoism, freedom from expectations, looking upon all with an equal eye, and freedom from desire, - these constitute the eternal religion of the good. Confidence, modesty, forgiveness, renunciation, purity, absence of laziness, absence of cruelty, absence of delusion, compassion to all creatures, absence of the disposition to calumniate, exultation, satisfaction, rapture, humility, good behaviour, purity in all acts having for their object the attainment of tranquillity, righteous understanding, emancipation from attachments, indifference, Brahmacharya (celibacy), complete renunciation, freedom from the idea of meum, freedom from expectations, unbroken observance of righteousness, beliefs that gifts are vain, sacrifices are vain, study is vain, vows are vain, acceptance of gifts is vain, observance of duties is vain, and penances are vain – those Brahmanas (priests) in this world, whose conduct is marked by these virtues, who adhere to righteousness, who abide in the Vedas, are said to be wise and possessed of correctness of vision.[Note: Compare from The Mahabharata, Aswamedha Parva, and Sec.XLIV): Brahma said: The Unmanifest is the source of all the worlds as, indeed, that is the end of everything. Days end with the sun's setting and Nights with the sun's rising. The end of pleasure is always sorrow, and the end of sorrow is always pleasure. All accumulations have exhaustion for their end, and all ascent have falls for their end. All associations have dissociations for their end, and life has death for its end. All action ends in destruction and all that is born is certain to meet with death. Every mobile and immobile thing in this world is transient. Sacrifice, gift, penances, study, vows, observances, - all these have destruction for their end. Of Knowledge, there is no end. Hence, one that is possessed of a tranquil soul, that has subjugated his senses, that is freed from the sense of meum (mineness), that is devoid of egoism, is released from all sins by pure knowledge.] Casting off all sins and freed from grief, those men possessed of wisdom attain to Heaven and create diverse bodies for themselves. Attaining the power of governing everything, self-restraint, minuteness, and these high-souled ones make operations of their own mind, like the gods themselves dwelling in Heaven. Such men are said to have their courses directed upwards. They are veritable gods capable of modifying all things. Attaining to Heaven they modify all things by their very nature. They get whatever objects they desire and enjoy them. Thus have I, ye foremost of regenerate ones, described to you what that conduct is which appertains to the quality of Goodness (Sattwa). Understanding this duly, one acquires whatever objects one desire. The qualities that appertain to Goodness have been declared particularly. The conduct which those qualities constitute has also been properly set forth. That man, who always understands these qualities, succeeds in enjoying the qualities without being attached to them. **Sattwa, Rajas & Tamas** Whatever object exists in this world, everything in it is fraught with the three qualities.

It is to be noted that the primary focus and locus of homologous repetitiveness and differentially instrumental activity we are talking about is the application of some certain Universal laws should not be mistaken for the Universalistic laws and particularistic laws themselves. All we are talking about is the application of paradigmatic relational content to specific investigating systems under consideration**.** On the other hand there certainly exist **Universalistic** Laws and Particularistic Laws. We are not in from any point of view talking about the imperative compatibilities and structural variabilities of the two different forms of laws but the application of say Einstein's Law of mass energy equivalence to some certain galaxy which is under investigation. Following essay allays and ameliorates the vestiges of doubt in the eventuality of confoundment between the two schools of thought we have essayed. It is simple application systems that are also investigatory and conforms and congruenential with the given Einsteinian Theory. **This universalism which is not one Linda M. G. Zerilli From: Diacritics Volume 28, Number 2, summer 1998 pp. 3-20 | 10.1353/dia.1998.0013 In lieu of an abstract, here is a brief excerpt of the content: Diacritics 28.2 (1998) 3-20 Review Essay Ernesto Laclau. Emancipation(s). London: Verso, 1996.** Judging from the recent spate of publications devoted to the question of the universal, it appears that, in the view of some critics, we are witnessing a reevaluation of its dismantling in twentieth-century thought. One of the many oddities about this "return of the universal" is the idea that contemporary engagements with it are more or less of a piece, and that they reflect a growing consensus that poststructuralist political theories are incapable of generating a viable alternative to the collective fragmentation that characterizes late modernity. The putative return to the universal marks, on this view, both a

homecoming to Enlightenment ideals -- purified of their more poisonous elements, of course -- and a reconciliation of sorts between those who refuted these ideals and those who sought to realize them. Now that "we" all know and agree that post structuralism is critically valuable but politically bankrupt; now that we all know and agree that the "old universal" was indeed a "pseudo-universal," so the homecoming narrative goes; we can get on with the project of constructing a "new universal." This authentic universal would really be inclusive of all people, regardless of race, class, gender, sexuality, ethnicity, nationality, and whatever else attaches to the "embarrassing etcetera" that, as Judith Butler reminds us, inevitably accompanies such gestures of acknowledging human diversity.

Before signing on to this felicitous agreement about "the necessity of universalism," we may wish to know whether we have anything like a minimal agreement in language, that is, whether we who speak of this universal are even speaking about the same thing. Apart from the not insignificant problem of translating from a philosophical to a political idiom, the whole question of this agreement is virtually occluded by the rush to rescue politics from the virulent particularisms that admit no common ground or sense of collective belonging. Presented in terms of the familiar binary couple, the choice between universalism and particularism seems settled by merely pointing to global and domestic political realities. Universalism is the only alternative to social fragmentation, wild child of the collapse of communism, the rise of deadly nationalisms, and the multiculturalist romance with particularism. To invoke the name of the universal in any affirmative sense is already to sign on to the political diagnosis and its solution. One of the many virtues of Ernesto Laclau's Emancipation(s) is that it offers both an alternative to the binarisms spawned by the "return" to the universal (for example, false universalism/true universalism) and a trenchant critique of the original binary couple itself (universalism/ particularism). Demonstrating the imbrications of the universal and the particular, Laclau shows why it is a matter not of choosing one over the other but of articulating, in a scrupulously political sense, the relation between the two. He thus explicitly rejects the notion that this relation is one of mutual exclusion, and shows that the tendency to see it as just that has led to the impasse of the contemporary debate, an impasse that is glossed over in some highly visible academic cases by proclaiming the necessary return to the universal. Although the language of universalism as spoken by Laclau searches for some common ground between particularists and Universalists, it is more by way of articulating their mutual contamination, that is, how each is rendered impure by the irreducible presence of the other. Aristotle assumes that there is a plurality of individual things (substances) that are characterized by intrinsic properties (forms) each. David Lewis, an analytical philosopher, provided the thesis of Humean supervenience: at the basic level of the world, there are only local qualities in the sense of intrinsic properties instantiated by space-time points or point-sized particles or field sources at space-time points. Space-time points can qualify as individual things in the above mentioned sense. Everything there is in a world like ours supervenes on the distribution of basic intrinsic properties over all space–time points. Whether really everything supervenes on that distribution is not relevant to the present paper. What is important here is the claim that, except for spatio-temporal relations, all the relations between the things at the basic level supervene on their intrinsic properties. We can apply the fundamental principles of mathematical proofs to locate to the True form of nature natural things: Through the systematic observation and analysis (breaking down and classification) of the natural world, in combination with rigorous logic we can make True statements about the natural world and understand: 1) The nature of essences (what something is) 2) The nature of causes (why things occur) Unlike Plato, Aristotle also believes that the other arts are very useful for helping us understand things. Relevant to our course is that he believes argument -- or dialectic -- is a key ingredient for people reaching understandings: by arguing over issues the truth and falsity of the claims becomes increasingly apparent, where Plato might have believed that honing such rhetorical arts only confuses the matter.

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_{+}$.

If instead of proving the existence of the solution on $\mathbb{R}_{+}$, we have to prove it only on a compact then it suffices to consider that $(a''_{i})^{(1)}$ and $(b''_{i})^{(1)},i=13{,}14{,}15$ depend only on T_{14} and respectively on $G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\ (t)=0\ and\ T_i\ (t)=0$

From 19 to 24 it results

$$G_i\ (t)\geq G_i^0 e^{\left[-\int_0^t\{(a'_i)^{(1)}-(a''_i)^{(1)}(T_{14}(s_{(13)}),s_{(13)})\}ds_{(13)}\right]}\geq 0$$

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(7)}(t)$:-

$(m_2)^{(7)} \leq \nu^{(7)}(t) \leq (m_1)^{(7)}$, $\boxed{\nu^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$

In a completely analogous way, we obtain

Definition of $u^{(7)}(t)$:- 420

$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}$, $\boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{36})^{(7)} = (a''_{37})^{(7)}, then\ (\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(\nu_1)^{(7)} = (\bar{\nu}_1)^{(7)}$ if in addition $(\nu_0)^{(7)} = (\nu_1)^{(7)}$ then $\nu^{(7)}(t) = (\nu_0)^{(7)}$ and as a consequence $G_{36}(t) = (\nu_0)^{(7)} G_{37}(t)$ **this also defines** $(\nu_0)^{(7)}$ **for the special case** .

Analogously if $(b''_{36})^{(7)} = (b''_{37})^{(7)}, then\ (\tau_1)^{(7)} = (\tau_2)^{(7)}$ and then $(u_1)^{(7)} = (\bar{u}_1)^{(7)}$if in addition $(u_0)^{(7)} = (u_1)^{(7)}$ then $T_{36}(t) = (u_0)^{(7)} T_{37}(t)$ This is an important consequence of the relation between $(\nu_1)^{(7)}$ and $(\bar{\nu}_1)^{(7)}$, **and definition of** $(u_0)^{(7)}$.

Proof : From global equations we obtain 421

$$\frac{d\nu^{(8)}}{dt} = (a_{40})^{(8)} - \left((a'_{40})^{(8)} - (a'_{41})^{(8)} + (a''_{40})^{(8)}(T_{41}, t)\right) - (a''_{41})^{(8)}(T_{41}, t)\nu^{(8)} - (a_{41})^{(8)}\nu^{(8)}$$

Definition of $\nu^{(8)}$:- $\boxed{\nu^{(8)} = \frac{G_{40}}{G_{41}}}$

It follows

$$-\left((a_{41})^{(8)}\left(\nu^{(8)}\right)^2 + (\sigma_2)^{(8)}\nu^{(8)} - (a_{40})^{(8)}\right) \leq \frac{d\nu^{(8)}}{dt} \leq -\left((a_{41})^{(8)}\left(\nu^{(8)}\right)^2 + (\sigma_1)^{(8)}\nu^{(8)} - (a_{40})^{(8)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(8)}, (\nu_0)^{(8)}$:-

For $0 < \boxed{(\nu_0)^{(8)} = \frac{G^0_{40}}{G^0_{41}}} < (\nu_1)^{(8)} < (\bar{\nu}_1)^{(8)}$

$$\nu^{(8)}(t) \geq \frac{(\nu_1)^{(8)} + (C)^{(8)}(\nu_2)^{(8)} e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_0)^{(8)}\right)t\right]}}{1 + (C)^{(8)} e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_0)^{(8)}\right)t\right]}} \quad , \quad \boxed{(C)^{(8)} = \frac{(\nu_1)^{(8)} - (\nu_0)^{(8)}}{(\nu_0)^{(8)} - (\nu_2)^{(8)}}}$$

it follows $(\nu_0)^{(8)} \leq \nu^{(8)}(t) \leq (\nu_1)^{(8)}$

In the same manner , we get 422

If $0 < (\nu_1)^{(8)} \leq (\bar{\nu}_1)^{(8)} \leq \boxed{(\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0}}$, we obtain 424

$$(\nu_1)^{(8)} \leq \nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\nu_0)^{(8)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(8)}(t)$:-

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

SECTION TWO

Conway-Kochen 'Free Will Theorem, Consciousness Et Al: Alis Grave Nil-Amicus Plato, Sed Magis Amica Veritas- Caesar Non Supra Grammaticos- Capax Infiniti Model

INTRODUCTION—VARIABLES USED

(1) C = h f where C= Consciousness, h= Planck's constant and f= frequency (Equation seen on a video: theory of everything)

(2) A theorem recently propounded by Princeton mathematicians John Conway (who invented the famous Game of Life) and Simon Kochen (one of the originators of the Kochen-Specker paradox of quantum mechanics) supports a powerful challenge to the scientific credentials of determinism, by showing that two cornerstones of contemporary science, namely acceptance of the scientific method as a reliable way of finding out about the world, and relativity theory's exclusion of faster-than-light transmission of information, **together (e)conflict with** determinism, in both its versions. Belief in determinism may thus come to be seen as notably unscientific. This conclusion has previously had some support from a theorem devised by John Bell and experiments undertaken by Alain Aspect, but Conway-Kochen theorem supports it more strongly. **(THE CONWAY-KOCHEN 'FREE WILL THEOREM': AND UNSCIENTIFIC DETERMINISM: David Hodgson**)

The proof of the theorem relies on three axioms, which Conway and Kochen call "fin", "spin", and "twin". The spin and twin axioms can be verified experimentally.

(3) Fin: There is a maximum speed for propagation of information (not necessarily the speed of light). This assumption rests upon causality. Maximum speed for propagation of information **(=)** finite

(4) Spin: The squared spin component of certain elementary particles of spin one, taken in three orthogonal directions, **will (=) be** a permutation of (1, 1, and 0).

(5) Twin: It is possible to "entangle" two elementary particles, and separate them by a significant distance, **so that (=) they** have the same squared spin results if measured in parallel directions a consequence of (but more limited than) quantum entanglement.

(6) In their later paper, "The Strong Free Will Theorem," Conway and Kochen weaken the Fin axiom (thereby strengthening the theorem) to a new axiom called Min, which asserts only that two experimenters separated in a space-like way **can (eb)make choices** of measurements independently of each other. In particular, they are not asserting that all information must travel finitely fast; only the particular information about choices of measurements.

The theorem

(7) The theorem states that, given the axioms, if the two experimenters in question are free to make choices about what measurements to take, **then the (eb) results** of the measurements cannot be determined by anything previous to the experiments.

(8) Since the theorem applies to any arbitrary physical theory consistent with the axioms, it would not even be possible to place the information into the universe's past in an ad hoc way. The argument proceeds from the Kochen-Specker theorem, **which (eb) shows that the** result of any individual measurement of spin was not fixed independently of the choice of measurements.

Limitations

Conway and Kochen do not prove that free will does exist. The definition of "free will" used in the proof of this theorem **is simply that** an outcome is "not determined" by prior conditions, and some philosophers strongly dispute the equivalence of "not determined" with free will. Some critics argue that the theorem only applies to deterministic models. Others have argued that the indeterminism that Conway and Kochen claim to have established was already assumed in the premises of their proof.

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,t]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \quad (186)$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ *and* $(\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13,14,15$ depend only on T_{14} and respectively on $G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t)=0$ *and* $T_i\,(t)=0$

From 19 to 24 it results

$$G_i\,(t)\geq G_i^0e^{\left[-\int_0^t\{(a_i')^{(1)}-(a_i'')^{(1)}(T_{14}(s_{(13)}),s_{(13)})\}ds_{(13)}\right]}\geq 0$$

$T_i\,(t) \geq T_i^0 e^{(-(b_i')^{(1)}t)} > 0$ for t > 0

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also G_{14} *and* G_{15} . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)}G_{14}$ and by integrating

$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1/(a_{14}')^{(1)}$

In the same way , one can obtain

$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2/(a_{15}')^{(1)}$

If G_{14} *or* G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} *is* bounded, from below, the same property holds for G_{14} *and* G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t),t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}\,(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}$, $\frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} < 1$ and to choose 190

$(\hat{P}_{16})^{(2)}$ *and* $(\hat{Q}_{16})^{(2)}$ large to have

$$\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}\left[(\widehat{P}_{16})^{(2)} + \left((\hat{P}_{16})^{(2)} + G_j^0\right)e^{-\left(\frac{(\hat{P}_{16})^{(2)}+G_j^0}{G_j^0}\right)}\right] \leq (\hat{P}_{16})^{(2)} \quad 191$$

$$\frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}\left[\left((\hat{Q}_{16})^{(2)} + T_j^0\right)e^{-\left(\frac{(\hat{Q}_{16})^{(2)}+T_j^0}{T_j^0}\right)} + (\hat{Q}_{16})^{(2)}\right] \leq (\hat{Q}_{16})^{(2)} \quad 192$$

It results

$$\left|\tilde{G}_{44}^{(1)} - \tilde{G}_i^{(2)}\right| \leq \int_0^t (a_{44})^{(9)}\left|G_{45}^{(1)} - G_{45}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\,ds_{(44)} +$$
$$\int_0^t\{(a'_{44})^{(9)}\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{-(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right)\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right) - (a''_{44})^{(9)}\left(T_{45}^{(2)}, s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)} - G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t} \leq$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)}(\widehat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)}, (T_{47})^{(1)};\ (G_{47})^{(2)}, (T_{47})^{(2)})\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ *and* $(\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i = 44,45,46$ depend only on T_{45} and

respectively on $(G_{47})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i\ (t) = 0\ and\ T_i\ (t) = 0$

From 99 to 44 it results

$$G_i\ (t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(9)} - (a_i'')^{(9)}(T_{45}(s_{(44)}), s_{(44)})\} ds_{(44)}\right]} \geq 0$$

$$T_i\ (t) \geq T_i^0 e^{(-(b_i')^{(9)} t)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2\ and\ \left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also $G_{45}\ and\ G_{46}$. indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a_{45}')^{(9)} G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1 / (a_{45}')^{(9)}$$

In the same way , one can obtain

$$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2 / (a_{46}')^{(9)}$$

If $G_{45}\ or\ G_{46}$ is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for $G_{45}\ and\ G_{46}$. The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t), t\right) = (b_{45}')^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t), t\right) < \varepsilon_9, T_{44}\ (t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right), \quad t = log\ \frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded. The same property holds for T_{46} if $\lim_{t\to\infty}(b_{46}'')^{(9)}\left((G_{47})(t), t\right) = (b_{46}')^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$$

Proof : From global equations we obtain 383

$$\frac{d\nu^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)\nu^{(1)} - (a_{14})^{(1)}\nu^{(1)}$$

Definition of $\nu^{(1)}$:- $\boxed{\nu^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(\nu^{(1)}\right)^2 + (\sigma_2)^{(1)}\nu^{(1)} - (a_{13})^{(1)}\right) \le \frac{d\nu^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(\nu^{(1)}\right)^2 + (\sigma_1)^{(1)}\nu^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(1)}, (\nu_0)^{(1)}$:-

For $0 < \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (\nu_1)^{(1)} < (\bar{\nu}_1)^{(1)}$

$$\nu^{(1)}(t) \ge \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(\nu_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\nu_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \le \nu^{(1)}(t) \le (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \le \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \le \nu^{(1)}(t) \le (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \le \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}} \le \nu^{(1)}(t) \le$$

$$\frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \le (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \le (\bar{\nu}_1)^{(1)} \le \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)} \le \nu^{(1)}(t) \le \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \le (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(1)}(t)$:-

$$(m_2)^{(1)} \leq v^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{v^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $v^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)} G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)} T_{14}(t)$ This is an important consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

Proof : From global equations we obtain 387

$$\frac{\mathrm{d}v^{(2)}}{\mathrm{dt}} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(\mathrm{T}_{17}, \mathrm{t})\right) - (a''_{17})^{(2)}(\mathrm{T}_{17}, \mathrm{t})v^{(2)} - (a_{17})^{(2)}v^{(2)}$$

Definition of $v^{(2)}$:- $\boxed{v^{(2)} = \frac{\mathrm{G}_{16}}{\mathrm{G}_{17}}}$ 388

It follows 389

$$-\left((a_{17})^{(2)}\left(v^{(2)}\right)^2 + (\sigma_2)^{(2)}v^{(2)} - (a_{16})^{(2)}\right) \leq \frac{\mathrm{d}v^{(2)}}{\mathrm{dt}} \leq -\left((a_{17})^{(2)}\left(v^{(2)}\right)^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)}\right)$$

From which one obtains 390

Definition of $(\bar{\nu}_1)^{(2)}, (\nu_0)^{(2)}$:-

For $0 < (\nu_0)^{(2)} = \frac{\mathrm{G}_{16}^0}{\mathrm{G}_{17}^0} < (\nu_1)^{(2)} < (\bar{\nu}_1)^{(2)}$

$$v^{(2)}(t) \geq \frac{(\nu_1)^{(2)} + (\mathrm{C})^{(2)}(\nu_2)^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}}{1 + (\mathrm{C})^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}} \quad , \quad \boxed{(\mathrm{C})^{(2)} = \frac{(\nu_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\nu_2)^{(2)}}}$$

it follows $(\nu_0)^{(2)} \leq v^{(2)}(t) \leq (\nu_1)^{(2)}$

In the same manner , we get 391

$$\nu^{(2)}(t) \leq \frac{(\bar{\nu}_1)^{(2)}+(\bar{C})^{(2)}(\bar{\nu}_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)}-(\bar{\nu}_2)^{(2)}\right)t\right]}}{1+(\bar{C})^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)}-(\bar{\nu}_2)^{(2)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(2)} = \frac{(\bar{\nu}_1)^{(2)}-(\nu_0)^{(2)}}{(\nu_0)^{(2)}-(\bar{\nu}_2)^{(2)}}}$$

From which we deduce $(\nu_0)^{(2)} \leq \nu^{(2)}(t) \leq (\bar{\nu}_1)^{(2)}$ 392

$$(\mu_2)^{(6)} \leq u^{(6)}(t) \leq (\mu_1)^{(6)}, \quad \boxed{u^{(6)}(t) = \frac{T_{32}(t)}{T_{33}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{32})^{(6)} = (a''_{33})^{(6)}, then\ (\sigma_1)^{(6)} = (\sigma_2)^{(6)}$ and in this case $(\nu_1)^{(6)} = (\bar{\nu}_1)^{(6)}$ if in addition $(\nu_0)^{(6)} = (\nu_1)^{(6)}$ then $\nu^{(6)}(t) = (\nu_0)^{(6)}$ and as a consequence $G_{32}(t) = (\nu_0)^{(6)} G_{33}(t)$ **this also defines** $(\nu_0)^{(6)}$ **for the special case** .
Analogously if $(b''_{32})^{(6)} = (b''_{33})^{(6)}, then\ (\tau_1)^{(6)} = (\tau_2)^{(6)}$ and then

INTRODUCTION—VARIABLES USED

Relaxed Bell inequalities and Kochen-Specker theorems: Michael J.W. Hall

(1) The combination of various physically plausible properties, such as no signaling, determinism, and experimental free will, is known **to be (ac = dc =0: STUDY ALL THE THREE CASES) incompatible** with quantum correlations.

(2) No signaling, determinism, and experimental free will, properties must be individually or jointly **relaxed (e)** in any model of such correlations.

(3) The necessary degrees of relaxation are quantified here**, (e&eb) via** natural distance and information-theoretic measures. Such quantification of necessary degrees of relaxation through (e&eb) natural distance and information theoretic measures **allows (eb)** quantitative comparisons between different models in terms of the resources, such as the number of bits, of randomness, communication, and/or correlation that they require. For example, measurement dependence is a relatively strong resource for modeling singlet state correlations, with only 1/15 of one bit of correlation **required (e)** between measurement settings and the underlying variable.

(4) It is shown how various 'relaxed' Bell inequalities may be obtained, **which (eb) precisely specify** the complementary degrees of relaxation required to model any given violation of a standard Bell inequality.

(5) The robustness of a class of Kochen-Specker theorems, **to** relaxation of measurement independence, is also investigated.

(6) It is shown that a theorem of Mermin remains **valid (eb)** unless measurement independence is relaxed by 1/3.

(7) The Conway-Kochen 'free will' theorem and a result of Hardy are less robust, **failing (e)** if measurement independence is relaxed by only 6.5% and 4.5%, respectively.

(8) An appendix shows the existence of an outcome independent model thereof is **equivalent to** the existence of a deterministic model. Journal reference: Phys. Rev. A 84, 022102 (2011) DOI: 10.1103/PhysRevA.84.022102 Cite as: arXiv:1102.4467 [quant-ph] (or

Bell's theorem, and its experimental tests, has shown that the two premises for Bell's inequality—locality and objective reality—**cannot (e) both hold in nature**, as Bell's inequality is broken. A simple test is proposed, which for the first time may decide which alternative nature actually prefers on the fundamental, quantum level. If each microscopic event is truly random (e.g., as assumed in orthodox quantum mechanics) objective reality is not valid whereas if each event is described by an unknown but deterministic mechanism (“hidden variables”) locality is not valid. This may be analyzed and decided by the well-known reconstruction method of Ruelle and Takens; in the former case no structure should be discerned, in the latter a reconstructed structure should be visible. This could in principle be tested by comparing individual “hits” in a double-slit experiment, but in practice a single fluorescent atom, and its (seemingly random) temporal switching between active/inactive states would possibly be better/more practical, easier to set up, observe, and analyze. However, only imagination limits the list of possible experimental setups.

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,\mathrm{t}]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \qquad (186)$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a_{13}')^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a_{13}'')^{(1)}$ and $(b_{13}'')^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13,14,15$ depend only on T_{14} and respectively on $G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\ (t)=0\ and\ T_i\ (t)=0$

From 19 to 24 it results

$$G_i\ (t)\geq G_i^0 e^{\left[-\int_0^t\{(a_i')^{(1)}-(a_i'')^{(1)}(T_{14}(s_{(13)}),s_{(13)})\}ds_{(13)}\right]}\geq 0$$

$$T_i\ (t)\geq T_i^0 e^{(-(b_i')^{(1)}t)}>0\quad \text{for t}>0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1,\left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: (187)

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13}<(\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt}\leq\left((\widehat{M}_{13})^{(1)}\right)_1-(a_{14}')^{(1)}G_{14}$ and by integrating

$$G_{14}\leq\left((\widehat{M}_{13})^{(1)}\right)_2=G_{14}^0+2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1/(a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15}\leq\left((\widehat{M}_{13})^{(1)}\right)_3=G_{15}^0+2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2/(a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If $G_{13}\ \ is$ bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$. The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. (188)

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\ (G(t),t))=(b_{14}')^{(1)}$ then $T_{14}\ \to\infty$. (189)

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t\ >t_1$

$$(b_{14})^{(1)}-(b_i'')^{(1)}(G(t),t)<\varepsilon_1, T_{13}\ (t)>(m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} < 1$ and to choose 190

$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)} (\widehat{k}_{44})^{(9)}\right) d\left(((G_{47})^{(1)}, (T_{47})^{(1)};\ (G_{47})^{(2)}, (T_{47})^{(2)})\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)} e^{(\widehat{M}_{44})^{(9)} t}$ *and* $(\widehat{Q}_{44})^{(9)} e^{(\widehat{M}_{44})^{(9)} t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i = 44{,}45{,}46$ depend only on T_{45} and respectively on (G_{47})(*and not on* t) and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 99 to 44 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(9)} - (a_i'')^{(9)}(T_{45}(s_{(44)}), s_{(44)})\} ds_{(44)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{(-(b_i')^{(9)} t)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2$ *and* $\left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also G_{45} *and* G_{46} . indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a'_{45})^{(9)} G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)} \left((\widehat{M}_{44})^{(9)}\right)_1 / (a'_{45})^{(9)}$$

In the same way , one can obtain

$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2/(a'_{46})^{(9)}$

If G_{45} *or* G_{46} is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for G_{45} *and* G_{46} . The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t),t\right) = (b'_{45})^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t),t\right) < \varepsilon_9, T_{44}(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right)$, $t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded. The same property holds for T_{46} if $\lim_{t\to\infty}(b''_{46})^{(9)}\left((G_{47})(t),t\right) = (b'_{46})^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

Proof : From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \leq \frac{dv^{(1)}}{dt} \leq -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(1)}, (\nu_0)^{(1)}$:-

For $0 < \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (\nu_1)^{(1)} < (\bar{\nu}_1)^{(1)}$

$$\nu^{(1)}(t) \geq \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(\nu_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\nu_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(1)}(t)$:-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)} G_{14}(t)$ this also

defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

Proof : From global equations we obtain 387

$$\frac{d\nu^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t)\right) - (a''_{17})^{(2)}(T_{17}, t)\nu^{(2)} - (a_{17})^{(2)}\nu^{(2)}$$

Definition of $\nu^{(2)}$:- $\boxed{\nu^{(2)} = \frac{G_{16}}{G_{17}}}$ 388

It follows 389

$$-\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_2)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right) \le \frac{d\nu^{(2)}}{dt} \le -\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_1)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right)$$

From which one obtains 390

Definition of $(\bar{\nu}_1)^{(2)}, (\nu_0)^{(2)}$:-

For $0 < (\nu_0)^{(2)} = \frac{G^0_{16}}{G^0_{17}} < (\nu_1)^{(2)} < (\bar{\nu}_1)^{(2)}$

$$\nu^{(2)}(t) \ge \frac{(\nu_1)^{(2)} + (C)^{(2)}(\nu_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}}{1 + (C)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}} \quad , \quad \boxed{(C)^{(2)} = \frac{(\nu_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\nu_2)^{(2)}}}$$

it follows $(\nu_0)^{(2)} \le \nu^{(2)}(t) \le (\nu_1)^{(2)}$

In the same manner , we get 391

$$\nu^{(2)}(t) \le \frac{(\bar{\nu}_1)^{(2)} + (\bar{C})^{(2)}(\bar{\nu}_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)} - (\bar{\nu}_2)^{(2)}\right)t\right]}}{1 + (\bar{C})^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)} - (\bar{\nu}_2)^{(2)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(2)} = \frac{(\bar{\nu}_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\bar{\nu}_2)^{(2)}}}$$

From which we deduce $(\nu_0)^{(2)} \le \nu^{(2)}(t) \le (\bar{\nu}_1)^{(2)}$ 392

If $0 < (\nu_1)^{(2)} < (\nu_0)^{(2)} = \frac{G^0_{16}}{G^0_{17}} < (\bar{\nu}_1)^{(2)}$ we find like in the previous case, 393

$$(\nu_1)^{(2)} \le \frac{(\nu_1)^{(2)} + (C)^{(2)}(\nu_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_2)^{(2)}\right)t\right]}}{1 + (C)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_2)^{(2)}\right)t\right]}} \le \nu^{(2)}(t) \le$$

Proof : From global equations we obtain

$$\frac{dv^{(7)}}{dt} = (a_{36})^{(7)} - \left((a'_{36})^{(7)} - (a'_{37})^{(7)} + (a''_{36})^{(7)}(T_{37},t)\right) - (a''_{37})^{(7)}(T_{37},t)v^{(7)} - (a_{37})^{(7)}v^{(7)}$$

Definition of $v^{(7)}$:- $\boxed{v^{(7)} = \frac{G_{36}}{G_{37}}}$

It follows

$$-\left((a_{37})^{(7)}\left(v^{(7)}\right)^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)}\right) \le \frac{dv^{(7)}}{dt} \le -\left((a_{37})^{(7)}\left(v^{(7)}\right)^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(7)}, (\nu_0)^{(7)}$:-

For $0 < \boxed{(\nu_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}}} < (\nu_1)^{(7)} < (\bar{\nu}_1)^{(7)}$

$$v^{(7)}(t) \ge \frac{(\nu_1)^{(7)} + (C)^{(7)}(\nu_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)} - (\nu_0)^{(7)}\right)t\right]}}{1 + (C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)} - (\nu_0)^{(7)}\right)t\right]}} \quad , \quad \boxed{(C)^{(7)} = \frac{(\nu_1)^{(7)} - (\nu_0)^{(7)}}{(\nu_0)^{(7)} - (\nu_2)^{(7)}}}$$

it follows $(\nu_0)^{(7)} \le v^{(7)}(t) \le (\nu_1)^{(7)}$

In the same manner , we get 417

$$v^{(7)}(t) \le \frac{(\bar{\nu}_1)^{(7)} + (\bar{C})^{(7)}(\bar{\nu}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(7)} = \frac{(\bar{\nu}_1)^{(7)} - (\nu_0)^{(7)}}{(\nu_0)^{(7)} - (\bar{\nu}_2)^{(7)}}}$$

From which we deduce $(\nu_0)^{(7)} \le v^{(7)}(t) \le (\bar{\nu}_1)^{(7)}$

If $0 < (\nu_1)^{(7)} < (\nu_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}} < (\bar{\nu}_1)^{(7)}$ we find like in the previous case, 418

$$(\nu_1)^{(7)} \le \frac{(\nu_1)^{(7)} + (C)^{(7)}(\nu_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)} - (\nu_2)^{(7)}\right)t\right]}}{1 + (C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)} - (\nu_2)^{(7)}\right)t\right]}} \le v^{(7)}(t) \le$$

If $0 < (\nu_1)^{(7)} \le (\bar{\nu}_1)^{(7)} \le \boxed{(\nu_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}}}$, we obtain 419

$$(\nu_1)^{(7)} \le v^{(7)}(t) \le \frac{(\bar{\nu}_1)^{(7)} + (\bar{C})^{(7)}(\bar{\nu}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}} \le (\nu_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(7)}(t)$:-

$$(m_2)^{(7)} \le v^{(7)}(t) \le (m_1)^{(7)}, \quad \boxed{v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$$

In a completely analogous way, we obtain

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad \boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

INTRODUCTION—VARIABLES USED

Bell's theorem. Experimental tests and implications J F Clauser and A Shimony

(1) Bell's theorem represents a significant advance in understanding the conceptual foundations of quantum mechanics. The theorem shows that essentially all local theories of natural phenomena that are formulated within the framework of realism may be tested using a single experimental arrangement. Moreover, the predictions by those theories must significantly differ from those by quantum mechanics. Experimental results evidently refute the theorem's predictions for these theories and favour those of quantum mechanics. The **conclusions (eb) are philosophically startling**:

Either one must totally abandon the realistic philosophy of most working scientists or dramatically revision of concept of space-time. Rep. Prog. Phys. 41 1881 doi:10.1088/0034-4885/41/12/002

Hidden Variables, Joint Probability, and the Bell Inequalities: Arthur Fine © 1982 The American Physical Society URL: http://link.aps.org/doi/10.1103/PhysRevLett.48.291 DOI: 10.1103/PhysRevLett.48.291 PACS: 03.50.Bz, 02.50. +s

It is shown that the following statements about a quantum correlation experiment are mutually equivalent.

(1) There is a deterministic hidden-variables model for the experiment. (2) There is a factorizable, stochastic model. (3) There is one joint distribution for all observables of the experiment, returning the experimental probabilities. (4) There are well-defined, compatible joint distributions for all pairs and triples of commuting and noncommuting observables. (5) The Bell inequalities hold.

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,\mathrm{t}]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \qquad (186)$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a_{13}')^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a_{13}'')^{(1)}$ and $(b_{13}'')^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on $G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\ (t)=0\ and\ T_i\ (t)=0$

From 19 to 24 it results

$$G_i\ (t)\geq G_i^0 e^{\left[-\int_0^t\{(a_i')^{(1)}-(a_i'')^{(1)}(T_{14}(s_{(13)}),s_{(13)})\}ds_{(13)}\right]}\geq 0$$

$$T_i\ (t)\geq T_i^0 e^{\left(-(b_i')^{(1)}t\right)}>0\quad \text{for t}>0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1,\left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: (187)

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13}<(\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt}\leq\left((\widehat{M}_{13})^{(1)}\right)_1-(a_{14}')^{(1)}G_{14}$ and by integrating

$$G_{14}\leq\left((\widehat{M}_{13})^{(1)}\right)_2=G_{14}^0+2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1/(a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15}\leq\left((\widehat{M}_{13})^{(1)}\right)_3=G_{15}^0+2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2/(a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If $G_{13}\ \ is$ bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$. The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. (188)

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\ (G(t),t))=(b_{14}')^{(1)}$ then $T_{14}\ \to\infty$. (189)

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t\ >t_1$

$$(b_{14})^{(1)}-(b_i'')^{(1)}(G(t),t)<\varepsilon_1,T_{13}\ (t)>(m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} < 1$ and to choose 190

$(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ large to have

$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)} (\widehat{k}_{44})^{(9)}\right) d\left(\left((G_{47})^{(1)}, (T_{47})^{(1)}; (G_{47})^{(2)}, (T_{47})^{(2)}\right)\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)} e^{(\widehat{M}_{44})^{(9)} t}$ *and* $(\widehat{Q}_{44})^{(9)} e^{(\widehat{M}_{44})^{(9)} t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i = 44{,}45{,}46$ depend only on T_{45} and respectively on (G_{47})(*and not on* t) and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 99 to 44 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(9)} - (a_i'')^{(9)}\left(T_{45}(s_{(44)}), s_{(44)}\right)\} ds_{(44)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(9)} t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2$ *and* $\left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also G_{45} *and* G_{46} . indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a'_{45})^{(9)} G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1 / (a'_{45})^{(9)}$$

In the same way , one can obtain

$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2/(a'_{46})^{(9)}$

If G_{45} *or* G_{46} is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for G_{45} *and* G_{46} . The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t),t\right) = (b'_{45})^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t),t\right) < \varepsilon_9, T_{44}(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right)$, $t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded. The same property holds for T_{46} if $\lim_{t\to\infty}(b''_{46})^{(9)}\left((G_{47})(t),t\right) = (b'_{46})^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

Proof : From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \leq \frac{dv^{(1)}}{dt} \leq -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(1)}, (\nu_0)^{(1)}$:-

For $0 < \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (\nu_1)^{(1)} < (\bar{\nu}_1)^{(1)}$

$$\nu^{(1)}(t) \geq \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(\nu_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\nu_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(1)}(t)$:-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)} G_{14}(t)$ this also

defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

Proof : From global equations we obtain 387

$$\frac{d\nu^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t)\right) - (a''_{17})^{(2)}(T_{17}, t)\nu^{(2)} - (a_{17})^{(2)}\nu^{(2)}$$

Definition of $\nu^{(2)}$:- $\boxed{\nu^{(2)} = \frac{G_{16}}{G_{17}}}$ 388

It follows 389

$$-\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_2)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right) \le \frac{d\nu^{(2)}}{dt} \le -\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_1)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right)$$

From which one obtains 390

Definition of $(\bar{\nu}_1)^{(2)}, (\nu_0)^{(2)}$:-

For $0 < (\nu_0)^{(2)} = \frac{G^0_{16}}{G^0_{17}} < (\nu_1)^{(2)} < (\bar{\nu}_1)^{(2)}$

$$\nu^{(2)}(t) \ge \frac{(\nu_1)^{(2)} + (C)^{(2)}(\nu_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}}{1 + (C)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}} \quad , \quad \boxed{(C)^{(2)} = \frac{(\nu_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\nu_2)^{(2)}}}$$

it follows $(\nu_0)^{(2)} \le \nu^{(2)}(t) \le (\nu_1)^{(2)}$

In the same manner , we get 391

$$\nu^{(2)}(t) \le \frac{(\bar{\nu}_1)^{(2)} + (\bar{C})^{(2)}(\bar{\nu}_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)} - (\bar{\nu}_2)^{(2)}\right)t\right]}}{1 + (\bar{C})^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)} - (\bar{\nu}_2)^{(2)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(2)} = \frac{(\bar{\nu}_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\bar{\nu}_2)^{(2)}}}$$

From which we deduce $(\nu_0)^{(2)} \le \nu^{(2)}(t) \le (\bar{\nu}_1)^{(2)}$ 392

If $0 < (\nu_1)^{(2)} < (\nu_0)^{(2)} = \frac{G^0_{16}}{G^0_{17}} < (\bar{\nu}_1)^{(2)}$ we find like in the previous case, 393

$$(\nu_1)^{(2)} \le \frac{(\nu_1)^{(2)} + (C)^{(2)}(\nu_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_2)^{(2)}\right)t\right]}}{1 + (C)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_2)^{(2)}\right)t\right]}} \le \nu^{(2)}(t) \le$$

Proof : From global equations we obtain

$$\frac{dv^{(7)}}{dt} = (a_{36})^{(7)} - \left((a'_{36})^{(7)} - (a'_{37})^{(7)} + (a''_{36})^{(7)}(T_{37},t)\right) - (a''_{37})^{(7)}(T_{37},t)v^{(7)} - (a_{37})^{(7)}v^{(7)}$$

Definition of $v^{(7)}$:- $\boxed{v^{(7)} = \frac{G_{36}}{G_{37}}}$

It follows

$$-\left((a_{37})^{(7)}\left(v^{(7)}\right)^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)}\right) \le \frac{dv^{(7)}}{dt} \le -\left((a_{37})^{(7)}\left(v^{(7)}\right)^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(7)}, (v_0)^{(7)}$:-

For $0 < \boxed{(v_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}}} < (v_1)^{(7)} < (\bar{v}_1)^{(7)}$

$$v^{(7)}(t) \ge \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_0)^{(7)}\right)t\right]}}{1 + (C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_0)^{(7)}\right)t\right]}} \quad , \quad \boxed{(C)^{(7)} = \frac{(v_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (v_2)^{(7)}}}$$

it follows $(v_0)^{(7)} \le v^{(7)}(t) \le (v_1)^{(7)}$

In the same manner , we get 417

$$v^{(7)}(t) \le \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(7)} = \frac{(\bar{v}_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (\bar{v}_2)^{(7)}}}$$

From which we deduce $(v_0)^{(7)} \le v^{(7)}(t) \le (\bar{v}_1)^{(7)}$

If $0 < (v_1)^{(7)} < (v_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}} < (\bar{v}_1)^{(7)}$ we find like in the previous case, 418

$$(v_1)^{(7)} \le \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_2)^{(7)}\right)t\right]}}{1 + (C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_2)^{(7)}\right)t\right]}} \le v^{(7)}(t) \le$$

$$\frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}} \le (\bar{v}_1)^{(7)}$$

If $0 < (v_1)^{(7)} \le (\bar{v}_1)^{(7)} \le \boxed{(v_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}}}$, we obtain 419

$$(v_1)^{(7)} \le v^{(7)}(t) \le \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}} \le (v_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(7)}(t)$:-

$$(m_2)^{(7)} \le v^{(7)}(t) \le (m_1)^{(7)}, \quad \boxed{v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$$

In a completely analogous way, we obtain

420

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad \boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

INTRODUCTION—VARIABLES USED

Wringing out better Bell inequalities Samuel L Braunstein and Carlton M Cavesb

(1) Local realism implies (eb) constraints on the statistics of two physically separated systems.
(2) These constraints, known collectively as Bell inequalities, **can be (eb) violated** by quantum mechanics. In other words quantum mechanics **violates (e)** Bell's inequality.
(3) The standard Bell inequalities apply to a pair of two-state systems and **constrain (e)** the value of some linear combination of correlation functions between the two systems.
(4) Authors generalize these standard Bell inequalities in two ways. First, we "chain" the Clauser-Horne-Shimony-Holt Bell inequality **to (eb)obtain** chained correlation Bell inequalities for two-state systems
(5) Real experiment shows that these chained Bell inequalities **lead (eb) to** stronger quantum violations. Second, we formulate information-theoretic Bell inequalities, which are written in terms of the average information obtained in several measurements on a pair of physically separated systems (not just two-state systems); these information Bell inequalities have an appealing interpretation: if local realism holds, **then (eb)** two systems must carry an amount of information consistent with the inequality.

Hidden quantum nonlocality revealed by local filters N. Gisin Group of Applied Physics, University of Geneva, 1211 Geneva 4, Switzerland http://dx.doi.org/10.1016/S0375-9601(96)80001-6, PHYSICS Letters A Volume 210, Issue 3, 8 January 1996, Pages 151–156

(6) Family of two spin states with the following properties is presented, these states are "local" in the sense that they do not violate any Bell—CHSH inequality which, however, after each spins interacts with two independent local environments, and the resulting states of the two spin systems **violate (e) a** Bell inequality.
(7) In particular, for mixed states the (e)violation of Bell's inequality for mixed states (problem of classifying the nonlocal states of two spin systems is still open) and the concept of nonlocality for mixed states differ
(8) The fact that some dissipative environments can increase quantum correlations **might (e) be useful for** quantum computation.
(9) Careless application of generalized quantum measurements **can (e) violates** Bell's inequality by more than $2\sqrt{2}$, even for mixtures of product states.

Theorem 9: if the conditions above are fulfilled, there exists a solution satisfying the conditions 153 B

Definition of $G_i(0)\,, T_i(0)$:

$$G_i(t) \le \left(\hat{P}_{44}\right)^{(9)} e^{(\hat{M}_{44})^{(9)}t} \quad , \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \le \left(\hat{Q}_{44}\right)^{(9)} e^{(\hat{M}_{44})^{(9)}t} \quad , \quad \boxed{T_i(0) = T_i^0 > 0}$$

Proof: Consider operator $\mathcal{A}^{(1)}$ defined on the space of sextuples of continuous functions $G_i\,,\ T_i\colon \mathbb{R}_+ \to \mathbb{R}_+$ which satisfy 154

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \qquad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+\ (a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_{+}$.

If instead of proving the existence of the solution on $\mathbb{R}_{+}$, we have to prove it only on a compact then it suffices to consider that $(a''_{i})^{(1)}$ and $(b''_{i})^{(1)},i=13{,}14{,}15$ depend only on T_{14} and respectively on $G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\ (t)=0\ and\ T_i\ (t)=0$

From 19 to 24 it results

$$G_i\ (t)\geq G_i^0 e^{\left[-\int_0^t\{(a'_i)^{(1)}-(a''_i)^{(1)}(T_{14}(s_{(13)}),s_{(13)})\}ds_{(13)}\right]}\geq 0$$

$$T_i\ (t)\geq T_i^0 e^{\left(-(b'_i)^{(1)}t\right)}>0\quad \text{for t}>0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1,\left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13}<(\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt}\leq\left((\widehat{M}_{13})^{(1)}\right)_1-(a'_{14})^{(1)}G_{14}$ and by integrating

$$G_{14}\leq\left((\widehat{M}_{13})^{(1)}\right)_2=G_{14}^0+2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1/(a'_{14})^{(1)}$$

In the same way , one can obtain

$$G_{15}\leq\left((\widehat{M}_{13})^{(1)}\right)_3=G_{15}^0+2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2/(a'_{15})^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} *is* bounded, from below, the same property holds for G_{14} *and* G_{15}. The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}(G(t),t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1$ and to choose 190

$$\int_0^t\{(a'_{44})^{(9)}\left|G_{44}^{(1)}-G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}+$$
$$(a''_{44})^{(9)}\left(T_{45}^{(1)},s_{(44)}\right)\left|G_{44}^{(1)}-G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}+$$
$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)},s_{(44)}\right)-(a''_{44})^{(9)}\left(T_{45}^{(2)},s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval $[0,t]$

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t}\le$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)}+(a'_{44})^{(9)}+(\widehat{A}_{44})^{(9)}+(\widehat{P}_{44})^{(9)}(\widehat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)},(T_{47})^{(1)};\ (G_{47})^{(2)},(T_{47})^{(2)})\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}\ and\ (\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i=44{,}45{,}46$ depend only on T_{45} and respectively on $(G_{47})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i\,(t)=0\ and\ T_i\,(t)=0$

From 99 to 44 it results

$$G_i\,(t)\ge G_i^0e^{\left[-\int_0^t\{(a_i')^{(9)}-(a_i'')^{(9)}(T_{45}(s_{(44)}),s_{(44)})\}ds_{(44)}\right]}\ge 0$$

$$T_i\,(t)\ge T_i^0e^{\left(-(b_i')^{(9)}t\right)}>0\quad \text{for t}>0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1,\left((\widehat{M}_{44})^{(9)}\right)_2\ and\ \left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also $G_{45}\ and\ G_{46}$. indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a'_{45})^{(9)} G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1/(a'_{45})^{(9)}$$

In the same way , one can obtain

$$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2/(a'_{46})^{(9)}$$

If G_{45} *or* G_{46} is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for G_{45} *and* G_{46} . The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t),t\right) = (b'_{45})^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t),t\right) < \varepsilon_9, T_{44}(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right)$, $t = log\frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded. The same property holds for T_{46} if $\lim_{t\to\infty}(b''_{46})^{(9)}\left((G_{47})(t),t\right) = (b'_{46})^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

Proof : From global equations we obtain

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2+(\sigma_2)^{(1)}v^{(1)}-(a_{13})^{(1)}\right)\le\frac{dv^{(1)}}{dt}\le-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2+(\sigma_1)^{(1)}v^{(1)}-(a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(1)},(\nu_0)^{(1)}$:-

For $0<\boxed{(\nu_0)^{(1)}=\frac{G_{13}^0}{G_{14}^0}}<(\nu_1)^{(1)}<(\bar{\nu}_1)^{(1)}$

$$v^{(1)}(t)\ge\frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_0)^{(1)}\right)t\right]}}\quad,\quad\boxed{(C)^{(1)}=\frac{(\nu_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\nu_2)^{(1)}}}$$

$$\text{it follows } (\nu_0)^{(1)}\le v^{(1)}(t)\le(\nu_1)^{(1)}$$

In the same manner , we get 384

$$v^{(1)}(t)\le\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}\quad,\quad\boxed{(\bar{C})^{(1)}=\frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)}\le v^{(1)}(t)\le(\bar{\nu}_1)^{(1)}$

If $0<(\nu_1)^{(1)}<(\nu_0)^{(1)}=\frac{G_{13}^0}{G_{14}^0}<(\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)}\le\frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}\le v^{(1)}(t)\le$$

$$\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}\le(\bar{\nu}_1)^{(1)}$$

If $0<(\nu_1)^{(1)}\le(\bar{\nu}_1)^{(1)}\le\boxed{(\nu_0)^{(1)}=\frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)}\le v^{(1)}(t)\le\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}\le(\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(1)}(t)$:-

$$(m_2)^{(1)}\le v^{(1)}(t)\le(m_1)^{(1)},\quad\boxed{v^{(1)}(t)=\frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)}\le u^{(1)}(t)\le(\mu_1)^{(1)},\quad\boxed{u^{(1)}(t)=\frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the

theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)} G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$ if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)} T_{14}(t)$ This is an important consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

Proof : From global equations we obtain 387

$$\frac{d\nu^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t)\right) - (a''_{17})^{(2)}(T_{17}, t)\nu^{(2)} - (a_{17})^{(2)}\nu^{(2)}$$

Definition of $\nu^{(2)}$:- $\boxed{\nu^{(2)} = \frac{G_{16}}{G_{17}}}$ 388

It follows 389

$$-\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_2)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right) \le \frac{d\nu^{(2)}}{dt} \le -\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_1)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right)$$

From which one obtains 390

Definition of $(\bar{\nu}_1)^{(2)}, (\nu_0)^{(2)}$:-

For $0 < (\nu_0)^{(2)} = \frac{G^0_{16}}{G^0_{17}} < (\nu_1)^{(2)} < (\bar{\nu}_1)^{(2)}$

$$\nu^{(2)}(t) \ge \frac{(\nu_1)^{(2)} + (C)^{(2)}(\nu_2)^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}}{1 + (C)^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}} \quad , \quad \boxed{(C)^{(2)} = \frac{(\nu_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\nu_2)^{(2)}}}$$

it follows $(\nu_0)^{(2)} \le \nu^{(2)}(t) \le (\nu_1)^{(2)}$

In the same manner , we get 391

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

INTRODUCTION—VARIABLES USED

A Markovian Model for Joint Observations, Bell's Inequality and Hidden States Ulrich Faigle, Alexander Schönhuth

(1) standard approach to quantum systems studies length preserving linear transformations of wave functions, the Markov picture focuses on trace preserving operators on the space of Hermitian (self-adjoint) matrices thus the Markov approach extends the standard one and provides(eb) **a** refined analysis of measurements and quantum Markov chains, in particular, Bell's inequality becomes structurally clear.
(2) Hidden state models are natural in the Markov context and in particular, a violation of Bell's inequality **is seen to (eb) be compatible** with the existence of hidden states.
(3) The Markov model moreover clarifies the role of the "negative probabilities" in Feynman's analysis of the EPR paradox. 60J99, 81P45, 81P68 Cite as: arXiv: 1011.1295 [cs.IT] (or arXiv: 1011.1295v2 [cs.IT] for this version)

(4) The fact that some dissipative environments can increase quantum correlations might (e) be useful for quantum computation.
(5) Careless application of generalized quantum measurements **can (e) violates** Bell's inequality by more than $2\sqrt{2}$, even for mixtures of product states.

Bell's inequality holds for all non-product states: N. Gisin

(6) Authors prove that any non-product state of two-particle systems **violates(e)** a Bell inequality

A theory of quantum gravity based on quantum computation Seth Lloyd

(7) This paper proposes a method of unifying quantum mechanics and gravity **based (e) on** quantum computation.
(8) In this theory, fundamental processes are described in terms of pair wise interactions between quantum degrees of freedom.
(9) The geometry of space-time is a construct, derived (e) from the underlying quantum information processing.
(10) The computation **gives (eb) rise to** a superposition of four-dimensional spacetimes, each of which obeys the Einstein-Regge equations. The theory makes explicit predictions for the back-reaction of the metric to computational `matter,' black-hole evaporation, holography, and quantum cosmology. Theorem 9: if the conditions above are fulfilled, there exists a solution satisfying the conditions 153 B

Definition of $G_i(0)\,, T_i(0)$:

$$G_i(t) \le \left(\hat{P}_{44}\right)^{(9)} e^{(\hat{M}_{44})^{(9)}t}\,, \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \le \left(\hat{Q}_{44}\right)^{(9)} e^{(\hat{M}_{44})^{(9)}t}\,, \quad \boxed{T_i(0) = T_i^0 > 0}$$

Proof: Consider operator $\mathcal{A}^{(1)}$ defined on the space of sextuples of continuous functions 154

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,t]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \quad (186)$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ *and* $(\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13,14,15$ depend only on T_{14} and respectively on $G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t)=0$ *and* $T_i\,(t)=0$

From 19 to 24 it results

$$G_i\,(t)\geq G_i^0e^{\left[-\int_0^t\{(a_i')^{(1)}-(a_i'')^{(1)}(T_{14}(s_{(13)}),s_{(13)})\}ds_{(13)}\right]}\geq 0$$

$T_i\,(t) \geq T_i^0 e^{(-(b_i')^{(1)}t)} > 0$ for t > 0

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also G_{14} *and* G_{15} . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)}G_{14}$ and by integrating

$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1/(a_{14}')^{(1)}$

In the same way , one can obtain

$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2/(a_{15}')^{(1)}$

If G_{14} *or* G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} *is* bounded, from below, the same property holds for G_{14} *and* G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t),t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}\,(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}$, $\frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} < 1$ and to choose 190

$(\hat{P}_{16})^{(2)}$ *and* $(\hat{Q}_{16})^{(2)}$ large to have

$$\int_0^t\{(a'_{44})^{(9)}\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{-(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right)\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right) - (a''_{44})^{(9)}\left(T_{45}^{(2)}, s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)} - G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t} \leq$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)}(\widehat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)},(T_{47})^{(1)};\ (G_{47})^{(2)},(T_{47})^{(2)})\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis (39,35,36) the result follows

Remark 41: The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ *and* $(\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i = 44,45,46$ depend only on T_{45} and

respectively on $(G_{47})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 42: There does not exist any t where $G_i\ (t) = 0\ and\ T_i\ (t) = 0$

From 99 to 44 it results

$$G_i\ (t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(9)} - (a_i'')^{(9)}(T_{45}(s_{(44)}), s_{(44)})\} ds_{(44)}\right]} \geq 0$$

$$T_i\ (t) \geq T_i^0 e^{(-(b_i')^{(9)} t)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2\ and\ \left((\widehat{M}_{44})^{(9)}\right)_3$:

Remark 43: if G_{44} is bounded, the same property have also $G_{45}\ and\ G_{46}$. indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a_{45}')^{(9)} G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1 / (a_{45}')^{(9)}$$

In the same way , one can obtain

$$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2 / (a_{46}')^{(9)}$$

If $G_{45}\ or\ G_{46}$ is bounded, the same property follows for G_{44} , G_{46} and G_{44} , G_{45} respectively.

Remark 44: If G_{44} *is* bounded, from below, the same property holds for $G_{45}\ and\ G_{46}$. The proof is analogous with the preceding one. An analogous property is true if G_{45} is bounded from below.

Remark 45: If T_{44} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t), t\right)) = (b_{45}')^{(9)}$ then $T_{45} \to \infty$.

Definition of $(m)^{(9)}$ and ε_9 :

Indeed let t_9 be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t), t\right) < \varepsilon_9, T_{44}\ (t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right), \quad t = log\ \frac{2}{\varepsilon_9}$ By taking now ε_9 sufficiently small one sees that T_{45} is unbounded. The same property holds for T_{46} if $\lim_{t\to\infty}(b_{46}'')^{(9)}\left((G_{47})(t), t\right) = (b_{46}')^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$$

Proof : From global equations we obtain 383

$$\frac{d\nu^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)\nu^{(1)} - (a_{14})^{(1)}\nu^{(1)}$$

Definition of $\nu^{(1)}$:- $\boxed{\nu^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(\nu^{(1)}\right)^2 + (\sigma_2)^{(1)}\nu^{(1)} - (a_{13})^{(1)}\right) \leq \frac{d\nu^{(1)}}{dt} \leq -\left((a_{14})^{(1)}\left(\nu^{(1)}\right)^2 + (\sigma_1)^{(1)}\nu^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(1)}, (\nu_0)^{(1)}$:-

For $0 < \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (\nu_1)^{(1)} < (\bar{\nu}_1)^{(1)}$

$$\nu^{(1)}(t) \geq \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(\nu_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\nu_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)} - (\nu_0)^{(1)}}{(\nu_0)^{(1)} - (\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)} + (C)^{(1)}(\nu_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}}{1 + (C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)} - (\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(1)}(t)$:-

$$(m_2)^{(1)} \leq v^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{v^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $v^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)} G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)} T_{14}(t)$ This is an important consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

Proof : From global equations we obtain 387

$$\frac{\mathrm{d}v^{(2)}}{\mathrm{dt}} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(\mathrm{T}_{17}, \mathrm{t})\right) - (a''_{17})^{(2)}(\mathrm{T}_{17}, \mathrm{t})v^{(2)} - (a_{17})^{(2)} v^{(2)}$$

Definition of $v^{(2)}$:- $\boxed{v^{(2)} = \frac{\mathrm{G}_{16}}{\mathrm{G}_{17}}}$ 388

It follows 389

$$-\left((a_{17})^{(2)}\left(v^{(2)}\right)^2 + (\sigma_2)^{(2)} v^{(2)} - (a_{16})^{(2)}\right) \leq \frac{\mathrm{d}v^{(2)}}{\mathrm{dt}} \leq -\left((a_{17})^{(2)}\left(v^{(2)}\right)^2 + (\sigma_1)^{(2)} v^{(2)} - (a_{16})^{(2)}\right)$$

From which one obtains 390

Definition of $(\bar{\nu}_1)^{(2)}, (\nu_0)^{(2)}$:-

For $0 < (\nu_0)^{(2)} = \frac{\mathrm{G}^0_{16}}{\mathrm{G}^0_{17}} < (\nu_1)^{(2)} < (\bar{\nu}_1)^{(2)}$

$$v^{(2)}(t) \geq \frac{(\nu_1)^{(2)} + (\mathrm{C})^{(2)}(\nu_2)^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}}{1 + (\mathrm{C})^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_0)^{(2)}\right)t\right]}} \quad , \quad \boxed{(\mathrm{C})^{(2)} = \frac{(\nu_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\nu_2)^{(2)}}}$$

it follows $(\nu_0)^{(2)} \leq v^{(2)}(t) \leq (\nu_1)^{(2)}$

In the same manner , we get 391

$$\nu^{(2)}(t) \leq \frac{(\bar{\nu}_1)^{(2)}+(\bar{C})^{(2)}(\bar{\nu}_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)}-(\bar{\nu}_2)^{(2)}\right)t\right]}}{1+(\bar{C})^{(2)}e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)}-(\bar{\nu}_2)^{(2)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(2)} = \frac{(\bar{\nu}_1)^{(2)}-(\nu_0)^{(2)}}{(\nu_0)^{(2)}-(\bar{\nu}_2)^{(2)}}}$$

From which we deduce $(\nu_0)^{(2)} \leq \nu^{(2)}(t) \leq (\bar{\nu}_1)^{(2)}$ 392

If $0 < (\nu_1)^{(2)} < (\nu_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (\bar{\nu}_1)^{(2)}$ we find like in the previous case, 393

$$(\nu_1)^{(2)} \leq \frac{(\nu_1)^{(2)}+(C)^{(2)}(\nu_2)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)}-(\nu_2)^{(2)}\right)t\right]}}{1+(C)^{(2)}e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)}-(\nu_2)^{(2)}\right)t\right]}} \leq \nu^{(2)}(t) \leq$$

Proof : From global equations we obtain

$$\frac{d\nu^{(7)}}{dt} = (a_{36})^{(7)} - \left((a'_{36})^{(7)} - (a'_{37})^{(7)} + (a''_{36})^{(7)}(T_{37}, t)\right) - (a''_{37})^{(7)}(T_{37}, t)\nu^{(7)} - (a_{37})^{(7)}\nu^{(7)}$$

Definition of $\nu^{(7)}$:- $\quad \boxed{\nu^{(7)} = \frac{G_{36}}{G_{37}}}$

It follows

$$-\left((a_{37})^{(7)}\left(\nu^{(7)}\right)^2 + (\sigma_2)^{(7)}\nu^{(7)} - (a_{36})^{(7)}\right) \leq \frac{d\nu^{(7)}}{dt} \leq -\left((a_{37})^{(7)}\left(\nu^{(7)}\right)^2 + (\sigma_1)^{(7)}\nu^{(7)} - (a_{36})^{(7)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(7)}, (\nu_0)^{(7)}$:-

For $0 < \boxed{(\nu_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}}} < (\nu_1)^{(7)} < (\bar{\nu}_1)^{(7)}$

$$\nu^{(7)}(t) \geq \frac{(\nu_1)^{(7)} + (C)^{(7)}(\nu_2)^{(7)} e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)} - (\nu_0)^{(7)}\right)t\right]}}{1 + (C)^{(7)} e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)} - (\nu_0)^{(7)}\right)t\right]}} \quad , \quad \boxed{(C)^{(7)} = \frac{(\nu_1)^{(7)} - (\nu_0)^{(7)}}{(\nu_0)^{(7)} - (\nu_2)^{(7)}}}$$

it follows $(\nu_0)^{(7)} \leq \nu^{(7)}(t) \leq (\nu_1)^{(7)}$

In the same manner , we get 417

$$\nu^{(7)}(t) \leq \frac{(\bar{\nu}_1)^{(7)} + (\bar{C})^{(7)}(\bar{\nu}_2)^{(7)} e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)} e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)} - (\bar{\nu}_2)^{(7)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(7)} = \frac{(\bar{\nu}_1)^{(7)} - (\nu_0)^{(7)}}{(\nu_0)^{(7)} - (\bar{\nu}_2)^{(7)}}}$$

From which we deduce $(\nu_0)^{(7)} \leq \nu^{(7)}(t) \leq (\bar{\nu}_1)^{(7)}$

If $0 < (\nu_1)^{(7)} < (\nu_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}} < (\bar{\nu}_1)^{(7)}$ we find like in the previous case, 418

$$(\nu_1)^{(7)} \leq \frac{(\nu_1)^{(7)}+(C)^{(7)}(\nu_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)}-(\nu_2)^{(7)}\right)t\right]}}{1+(C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\nu_1)^{(7)}-(\nu_2)^{(7)}\right)t\right]}} \leq \nu^{(7)}(t) \leq$$

If $0 < (\nu_1)^{(7)} \leq (\bar{\nu}_1)^{(7)} \leq \boxed{(\nu_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}}$, we obtain 419

$$(\nu_1)^{(7)} \leq \nu^{(7)}(t) \leq \frac{(\bar{\nu}_1)^{(7)}+(\bar{C})^{(7)}(\bar{\nu}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}}{1+(\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{\nu}_1)^{(7)}-(\bar{\nu}_2)^{(7)}\right)t\right]}} \leq (\nu_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have
Definition of $\nu^{(7)}(t)$:-

$(m_2)^{(7)} \leq \nu^{(7)}(t) \leq (m_1)^{(7)}$, $\boxed{\nu^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$
In a completely analogous way, we obtain

$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}$, $\boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

Superposition Of Four-Dimensional Spacetimes, Geometry Of Space-Time Is A Construct, Quantum Gravity From Quantum Computation Et Al. : A Caelo Usque Ad Centrum-A Bene Placito-Gesamtkunstwerk –Gestalt Model

INTRODUCTION—VARIABLES USED

One Response to Quantum Gravity from Quantum Computation: Jeff Hodges says: 1/25/2005 at 9:04 pm (I have deleted paragraphs due to spatial constraints. However the point author makes is clearly conspicuous)

From A3.4, pg 27:

(1) A fluctuating cosmological term then arises naturally…This picture of a fluctuating cosmological 'constant' with a scale given by the age of the universe **is (e&eb) consistent with** the causal set account of a fluctuating cosmological term.

From A3.5 (the necessary discussion about "scaling up" to the classical world):

(2) In other words, the computational universe naturally **gives(eb) rise to the** a semiclassical spacetime via the decoherent histories approach to quantum mechanics…Coarse-graining about stable histories yields hydrodynamic variables that approximately decohere and obey classical probabilites.

Bell inequality, Bell states and maximally entangled states for n qubits: N Gisin, H Bechmann-Pasquinucci Group of Applied Physics, University of Geneva, 1211 Geneva 4, Switzerland http://dx.doi.org/10.1016/S0375-9601(98)00516-7

(3) First, authors present a Bell-type inequality for n qubits, assuming that m out of the n qubits is independent. Quantum mechanics ***violates (e) this*** inequality by a ratio that increases exponentially with m.
(4) Hence an experiment on n qubits violating this inequality sets (eb) a lower bound on the number m of

entangled qubits.

(5) Next, they propose a definition of maximally entangled states of n qubits. For this purpose authors study five different criteria. Four of these criteria are found compatible. For any number n of qubits, **they (eb) determine** an orthogonal basis consisting of maximally entangled states generalizing the Bell states.

The Violation of Bell Inequalities in the Macro world Diederik Aerts, Sven Aerts, Jan Broekaert, Liane Gabora Foundations of Physics September 2000, Volume 30, Issue 9, pp 1387-1414 Springer Link

(6) Authors show that Bell inequalities can be violated in the macroscopic world. The macro world violation is illustrated using an example involving connected vessels of water. Authors show that whether the violation of inequalities occurs in the micro world or the macro world, it is the identification of nonidentical events that plays a crucial role.

(7) Specifically, they prove that if nonidentical events are consistently differentiated, Bell-type Pitowsky inequalities **are (eb) = e(e) no longer violated**, even for Bohm's example of two entangled spin 1/2 quantum particles.
