In counterpoint, the silver subject image begins to pulsate. These pulsations create a rhythm. Their interaction might be said to create a sensation of 'forced movement' (Deleuze, 1981: 48-9; Deleuze and Guattari, 1994: 167-8). Barbara Kennedy describes Deleuze's concept of 'forced movement' as a sensation that activates a space (Kennedy, 2000: 113). She notes that, in the sensation of 'forced movement', space becomes ‘a molecular element' in the connection between images (ibid, 114). For the viewer, situated in the gap between images, this sensation is enacted through, across and around their body. The interaction of these intensities (silver and gold) reconfigures consciousness. Rather than being the property of a subject who directs her awareness like 'flashlight illuminating a dark world' (Bogue, 2003: 34), consciousness is presented as an impulse, a vibration, and a play of light within matter. forwarded in nine module systematizations, the entire gamut is to be seen in a single shot, and the presentation of nine schedule twenty seven storey models is to circumvent typing of hundreds of superscripts and subscripts. In fact the statement is made inclusive of all previous models, and the variables are definitely different for each schedule, which again is reinstated due to typing of corresponding variables millions of systems, a fastidious and fussy work again. I beg pardon for any inconvenience caused to the readers due to such utilization of convention. **I put on recordial evidence and acknowledge my heartfelt thanks for the contribution of dear professor Gnanendra Prabhu for sharing his elephantine and versatile knowledge about, differential topology, functional analysis, complex analysis and philosophy**. I am grateful to professor Chadralekha MD PhD. Tagore medical College, Chennai for deliberations and discussions on Medicine. To discussions on Physics topics credit goes to Dr. A.S. Krishna Prasad, Former Director DRDO Chapter, and Bangalore Chapter. Prof. Sunita MSc. PhD., of MS Ramaiah University helped me with valuable suggestions on Aerodynamics and propellant chemistry. Pantulu, former Chairman of NALCO, ESSAR Steels helped in formatting process. To Dr. Pradeep a PhD, from Stony Brook School, goes the credit of bringing attention to beautiful poems which I would never write. Dr. Kalpana Doraiswamy, a practising psychologist helped in Jungian analysis. Dr.B.J, Gireesha and Professor Nirmala of Jawaharlal Engineering College were extensively useful in fluid mechanical analysis with quick stimulus.

Note: Notion of Understood as a unitary phenomenon (as opposed to a contingent, additive, tripartite combination of Being, in-ness, and the world), Being-in-the-world is an essential **characteristic of** Dasein .Being-in-the-world **provides us** with a reinterpretation of the activity of existing (Dreyfus 1990, 40), where existence is given the narrow reading (existence) identified earlier,. There are systems that satisfy this condition by Heidegger and we take in to consideration the characterstics of the system based on which the stratificational stratagem is formatted. Here we talk of the characterstics of systems which satisfy the condition of cosmological constant. There are lots of zeroes corresponding and concomitant to the second law of black holes. Infact as many as that of extant and existential blackholes exist. There are various systems which satisfy the Husserlian flux conditions. Characterstics form the fulcrum of classification. At the outset, it is to be stated that there are hadrons in every system. Supersymmetry between forces and matter, with both open and closed strings; no tachyon; group symmetry is SO (32) and its axiomatic predications, predicational anteriorities, character constitution shall be extant and existential in very many systems, and the characterstics are taken in to consideration in the classification scheme. Many systems have such fundamental instabilities like that of quantum gravity and characterstics of those systems form the citadel and fulcrum, bulwark and manor, mainstay and reinforcement, alcazar and chateau theory has a fundamental instability on which the classification schémas are valid. There are lots of systems which follow the axioms of string theory .It is the characterstics of this system which are taken in to consideration in the classification scheme. There are various systems that have the same bastion, support system, stylobate and sentinel as that of the Deleuzean terms and predications and phenomenological methodologies systemized. Each and every system has electrons, neutrons and protons and for that matter quarks. There shall be strong nuclear force and weak nuclear force. There are many systems that satisfy the criterion specified by the equation, principle or statement in question. Characterstics of the investigating systems form the bastion for the classification scheme and doxa thereof. Systemic differentiation is conducted. Despite gravity being constant, there exists gravity between two objects, and this could be taken as a system. Depending upon some parametric representationalities, functionalities, advantageousness, appropriateness, benefit, facilitation, fittingness, helpfulness, instrumentality, merit, practicality, serviceability, suitability, and usefulness, utility, these systems could be classified in to various categories. In respect of an equation, there shall be many systems that satisfy the given equation. Equations themselves could be by the utilization of the model solved term by term as has been exemplified and illustrated many time in the previous papers. There is lot of systems that could be brought in to the orbit of and gamut of the theory in question which the investigatable systems satisfy the axiomatic predications and postulation alcovishness of the systems in question. Towards the end of classificational consummation, consolidation, corporation and concatenation we take the characterstics of the systems, the predicational interiorities, ontological consonance and primordial exactitude, accolytish representations, functional topology, apocryphal aneurism and atrophied asseveration, event at contracted points, and other parameters as the bastion and stylobate of the stratification purposes. Such totalistic entities would

have easy paradigm of relational content, differentiated system of expressly oriented actions with primary focus and locus of homologues receptiveness and differentially instrumental activity, variable universalism and particularism, imperative compatibilities and structural variabilities, interactional dynamical orientation, institutionalization and internalisation of pattern variables common attitudinal orientation of constituionalisation of internalized dispositions, and a qualitative gradient of structural differentiation and ascribed particularistic solidarity abstraction or interactional dynamics, internal differentiation, structural morphology, formal characterization, concept formulation, phenomenological methodologies, constituent structure, transformational minimal condition, paradigmatic feasibilities, programmatic plausibilities, comparative variability, normative aspect of expectational prediction, projection and prognostication as consideration of the investigatory systems. Any scale can be used that is convenient to the classification scheme. It is important to note that the scheme of classification and the stratification doxa must not be adversely antagonistic, inexorably irreconcilable, antithetically antipodal, diametrically opposed, repugnantly retrogressive, inimically inverse, violatively unsimilar, diversely dissimilar, antipathetically anti thetical, conflictingly combative, obstructively pugnacious, inimically obstructive, repellently restrictive, disputatiously gainsaying or conformingly pugnacious to the axiomatic predications and postulation alcovishness of the theory in question or the equation representative or constitutive thereof. Sole intention, main objective and primary aim is twofold. One is towards the end of circumvention of the extra equation and the concomitant and corresponding variable therein. Second is avoidance of clustered congest, swarmed huddle, mustered pack, sardine squash, and swamp throng in the scheme of classification. Only thing that is sought out is the consonance in the entire diaspora and body fabric of the systems under study. This statement is true and holds unmistakably true for all the papers and I sincerely entreat readers to remember the statement and read the paper against this background. When we write A+B we mean by that B is being added to A or vice versa. It is like adding milk to water and water to milk. There may or may not be a time gap. As said earlier there may be many systems that satisfy the conditions of the equations and those systems that are investigatory or investigatable are taken in to consideration based on their characterstics in the classification doxa. When there are more than two entities, we can take logarithm and find the value of that factor to be taken with anti log to obtain prediction and projected values of the model. In case of A-B, we are removing B from A and that means B is eating up A. These factors are taken in to consideration in the application of the model to equations. Log (ab) and Log (a+b) is well defined. Model stands out as universal testament and template for application to each sentence and equation what with the quantification process done and the correlations well defined. In the eventuality of non existence of any connection at some phase, the model would have the accentuation and attrition coefficients and detritions coefficients as zero rendering the equations of concatenation simpler. Projection formula which incorporates in its diaspora the initial values provide autheticative determination, unimpeachable validation, incontrovertible establishment , apodictic evidence, reliable roll out, unfailing cinquecento quattrocento trecento, incontrovertible indication of the final finale, notwithstanding appellation, appellative, brand, cognomen, compellation, designation, flag, handle, identification, label, moniker, nomen, slot, style, surname, tab, tag, term, title designation, appellation, appellative, class, classification, denomination, description, epithet, of the classification scepter, scenario, scimitar, schottische. There is pure and impure consciousness in every one. Gratification producing and deprivation producing one's can be easily classified from individual general ledgers. Similar analogy holds for collective general ledger and cosmic general ledger or nature's general ledger. It is also to be noted that while dealing with equations towards the end of consummation of the measure, it is necessary that the two variables are to be classified in to three sections and each one would have the adventitious and decidedly stated relationship whereby the fundamental equations are drawn up and the analysis made. All the parametric representationalities, conditionalities, orientationalities remain unequivocal as stated in the variables stated in to consideration section and are different from module to module. In essence the paper is to be read as holistic one with the sole intention, primary objective and raison d' etre to build a TOE. Towards the end of circumvention of typing hundreds of superscripts and subscripts which would be a sardine squash and the concomitant operational difficulties, model is presented in piece meal of nine modules. Logarithms are to be taken in respect of those which incorporate more than one variable in bra-ket. Values of log (ab) and log (a+b) are readily available. Anti logarithm shall be taken at the end to predict, project, prognosticate the value of the variable. This is true for tensors, vectors and other variables too. Affirmational assertion, and explanation justification, statement of

vindication, annotational commentary, and explicational glossary for each and every system changes and physical interpretation of results is one thing that is to be with earnest endeavour and feverish and febrile expediency. Editions never ever mean the same and identicality of parameters and this has been explicitly and unmistakably stated in the model apriori itself. Akin and analogous, cognate and concurrent, correspondent and congruent, comparable and complementary, synonymous and duple, tantamount and agnate, commensurate and correlative representation is only to highlight the importance and subterfuge the replication of work. It is my fervent solicitation to kindly bear with me for any lapses, notwithstanding the orchestrated efforts for a paper without any minor errors. Postulation predication, conclusive presumption, differential presuppositions, underscored decidedly axiomatic statement of the statement, equation form the bye word or the watch word in the aggrandizement-amplification, caricature and crock, understatement- unembellishment, elocution-emphasis, enunciation-inflection, announcement-argument, articulation, assertion, asseveration, choice of words, commentary and communication, declaration and definition, delivery-diction, elucidation-emphasis, enunciation-execution, explanation, exposition-formulation, idiom, interpretation and intonation tone and tenor of stratification. Now, how do find the reaction of systems to these singularities. You do the same thing a boss does for you. "Problematize" the events and see how you behave. I will resort to "pressure tactics". "intimidation of deriding report", or "cut in the increment" to make you undergo trials, travails and tribulations. I am happy to see if you improve your work; but may or may not be sad if you succumb to it and hang yourself! We do the same thing with systems. systems show conducive response, felicitous reciprocation or behave erratically with inner roil, eponymous radicality without and with blitzy conviction say like a solipsist nature of bellicose and blustering particles, or for that matter coruscation, trepidiational motion in fluid flows, or seemingly perfidious incendiaries in gormandizing fellow elementary particles, abnormal ebullitions, surcharges calumniations and unwarranted(you think so but the system idoes not!) unrighteous fulminations. So the point that is made here is "like we problematize the "events" to understand the human behaviour we have to "problematize" the events of systems to understand their behaviour. This statement is made in connection to the fact that there shall be creation or destruction of particles or complete obliteration of the system (blackhole evaporation) or obfuscation of results. Some systems are like "inside traders" they will not put signature atoll! How do you find they did it! Anyway, there are possibilities of a CIA finding out as they recently did! So we can do the same thing witn systems to. This is accentuation, corroboration, fortification, .fomentatory note to explain the various coefficients we have used in the model as also the dissipations called door. In the bank example we have clarified that various systems are individually conservative, and their conservativeness extends holisticallytoo.that one law is universal does not mean there is complete adjudication of nonexistence of totality or global or holistic figure. Total always exists and "individual" systems always exists, if we donot bring Kant in to picture! For the time being let us not! Equations would become more ensorcelled and frenzied..... philosophy merges with ontology; ontology merges with univocity of being; analogy has always a theological vision; not a philosophical vision; one becomes adapted to the forms of god; self and world; the univocity of being does not mean that there is one and the same being; on the contrary, beings are multiple and different they are always produced by disjunctive synthesis; and they themselves are disintegrated and disjoint and divergent; membra disjuncta.the univocity of being signifies that that being is a voice that is said and it is said in one and the same "consciousness". Everything about which consciousness is spoken about being is the same for everything for which it is said like gravity; it occurs therefore as an unique event for everything; for everything for which it happens; eventum tantum; it is the ultimate form for all of the forms; and all these forms are disjointed; it brings about resonance and ramification of its disjunction; the univocity of being merges with the positive use of the disjunctive synthesis, and this is the highest affirmation of its univocity like gravity; it is the eternal resurrection or a return itself, the affirmation of all chance in a single moment, the unique cast for all throws; a simple rejoinder for Einstein's god does not play dice; one being, one consciousness, for all forms and all times. a single instance for all that exists, a single phantom for all the living; a single voice for very hum of voices; or a single silence for all the silences; a single vacuum for all the vacuums; consciousness should not be said without occurring; if consciousness is one unique event in which all the events communicate with each other; univocity refers both to what occurs to what it is said. This is attributable to all states of bodies and states of affairs and the expressible of every proposition. So univocity of consciousness means the identity of the noematic attribute and that which is expressed linguistically and sense fully. Univocity means that it

does not allow consciousness to be subsisting in a quasi state and but expresses in all pervading reality; CONSCIOUSNESS AND ITS UNIQUENESS June 12, 2012 at 8:40pm (See Deleuze Logic of sense, Wikipedia and Stanford encyclopedia for more details) Atrocious contrivance and device, gratificational primogeniture, calamitous dodge and expedient, depraved, destructive, disastrous, execrable gambit and gimmick, great solace and succor, iniquitous, injurious, loathsome, low, maleficent, malevolent machination and maneuver, promethaleon of candor, frankness, honesty, honor, ingenuousness, innocence, openness, reality, sincerity, truthfulness, spiteful, stinking, ugly, unpleasant, unpropitious play and ploy, progenitor of jurisprudence and circumspection, racket and ruse, savvy, scam, stratagem, subterfuge, tactic and wile, forthrightness, honesty, truthfulness embodied and personified is the structural predisposition and dispensation of the complex. Nobody need have to take the Brahman-Anti Brahman agency to be a recalcitrant, repugnant, and refractory proposition. God gives and also takes away. That is the point made. And of course lesser gods, and God doth follow them and they follow God. That is why they are lesser gods. And wield the power on lesser mortals like us. When we mean gratification and deprivation we mean celestial Brahman Anti Brahman and Terrestial Brahman and Anti Brahman agencies producing such happiness or sadness by any means such as (blending- amalgamation, adulterant-adulteration, amalgam-amalgamation, blend- combination, composite- compound, debasement-denaturant, fusion-hybrid, intermixture-reduction, amalgam- mixture, composite- compound, fusion-mishmash, aggregate- alloy, amalgamation-blend, commixture-composite, composition-compost, conglomerate-fusion, goulash-medley, mishmash-stew, blend-coalition, commixture-compound, federation-heating, integration-junction, melting-merger, synthesis-unification, assortment- combination, adulteration-alloy, assimilation-association, batter-blend, brewed combine, composite compound, concoction confection, conglomeration cross of money, orientation(dis), penury creation, murder, mayhem plunder, pillage, apocalypse, Armageddon in various forms and permutation and combination of Manichaean artifice, agathokakological malevolence, agley chicane fourberie, fraud, furtiveness, gambit, awry and bad ,flagitious mechanizations, cacodemonic gambit, hanky-panky, intrigue, machination, deprecatory and diabolic underhandedness and wiles, energumenical skullduggery, execrable and goetic chicanery, lenocinant stratagem, malefic and maleficent strategy, malominous sell, sellout, sham subterfuge, peccable, humbug, imposture, misrepresentation peccant fraud, fraudulence, hoax, qued , scelerate pretense, ruse, sell, sellout, sham stratagems' of maladroit manouevures , sinistral ,tortious and venal sophistry, contingency enterprise, endangerment emprise, jeopardizing adventure, jejune jeremiad, avoidable inertia, latent passiveness: with each action accounted and showing balance in the nature's general ledger as also actionlessness:e). All these are recorded in Nature's general ledger. Neuron DNA encapsulates all the actions passions, actions, interactions, transactions or the lack of it at various levels of individual, collective and cosmic levels. In celestial Brahman Anti Brahman ledger there is cessation of dualities. One more point to be made is if 5=3+2, then we can say 5 gormandizes 3 or 5 gobbles up 2. Quintessentially such a statement arises out of the difference of LHS and RHS term wise. It must be remembered despite all theoretical abstractions and generalizations be it proton mass or Higgs Boson, or topology of a space, it is notwithstanding the fundamentality of nature is just a number. Just everything in Physics and mathematics is just a number. Let us assume I buy rice in Bangalore (District) worth 5k.g. I can always divide 5k.g.s of rice in categories of Bangalore (South), Bangalore (west), Bangalore (East) and Bangalore (South). On similar basis, there are billions of neutrons, protons and concomitant interactions which would satisfy the given numerical value. Example of gravity above makes things clear. Everything atleast is a function of time and someplace or some other coordinates, subordinates or superordinates. Mass of proton is 2.47 does not mean total mass of all protons is 2.47. It is this argument that is used in the classification scheme. By the very nature, self the unmonitoring but the witness consciousness agency identifies itself with something, be it a profession, an actor on the screen, when it does not have a identity. Such examples are legion, a Charlie Chaplin in "The Kid" or Raj kapoor in "Jagte Raho". These are people who just wanted to live and living without being put under surveillance every moment is the greatest part of their life. This is "Absolute Subjectivity" of Shiva. Such a state is always craving for identification for in pure consciousness all identities are lost. It is this "identitylessness" or having very minimal identity is what pervades most in India and this is due to expansion of individual consciousness. When that happens, be it education, or wealth, the "identity' becomes so well entrenched, they become the exact opposite of "pure consciousness"," impure consciousness" (Shakti). This is a state of "Absolute or relativistic objectivity". There was

this case of a lady who went to such an extent of planning, she was sure that whatever she does must work out. When it did not, she lapsed in to "identity crisis". Such thing as this might happen in well developed countries where the competition is extremal and to be achieved at any cost. Realisation that one is not the doer but the witness consciousness is just like watching a movie in which one has acted. It is in this sense "advaita", "non duality' seems to be of cardinal and preeminent importance for the analytical treat ment of "identity' and "identity lessness", both happen in space time. "Multiverses" in this sense is also like a different film of an actor released at different theaters and it is in this sense we state that that every object in space time is a multiverse. You must have totally immersed in doing a "string theory" problem or watching a "film", oblivious of surroundings. Essentially creation (space time) also is what is happening in mind and honed in to you billion times. Identification of anything with a designation or signification is one that leads to association within spacetime, which would only have pathological consequences and detrimental ramification as stated above or positive implications of "happiness" because of the identity itself. Search or 'show" has to go on! It gives a sense of consummation. Like the discussion of psephologists now doing about electoral results in India!

Prakruti Kshobha and Prakruti siddhi: An ode to subjective world in the objective world: Conscious action feedback changes the subject or a particle:

In Devi Mahatme, production of Prakruti Kshobha and Prakruti siddhi is mentioned as in the following. It is to be noted that when a subject or a particle is exposed to a force field continuously or torture continuously without any chance of rebelling, it/he or she shall succumb to it or become recalcitrant, repugnant refractory. One should write the letters of the mantra six by six in a nine angled design surrounded by two circles, outside of this there being an octangle design surrounded by two circles, all surrounded by a bhupura. Within the octangle, and outside of the circles, and in the bhupura, one should write the matrikas both clockwise and anticlockwise. One should write the name (of the target) in all the directions, and should worship the eight armed form, Auspicious One, Parameshvari, employing the method previously stated, the target becomes paralyzed. Red substances, ghee, blossoms of the Kimshuka, Bandhuka, Japa, Pala, Karavira, Kahlara, lotus, Patala, Ashoka and various other red blossoms, One should draw a triangle enclosed in a circle, outside of this drawing a hexagon, another hexagon, an octangular figure, and another hexagon. From the edges to the middle one should write the naksatra, tithi and day (of the target's birth), also writing all the matrikas letters. In the centre of each of the seven mandalas, one should write the matrikas in clockwise order. One should place Hrim in the centre. If one should worship this one obtains all siddhi. One may command bhutas, pretas, pishachas and so forth, causing disease, attacks by elephants and other wild beasts, or pacifying them. From the North West, south east, south west and north east, draw 12 lines, making a vajra figure of 21 compartments. In the centre of these one should draw the name of whatever is to be accomplished, outside of this, in a clockwise direction, writing the letters of the alphabet. After worshipping this and drawing it, whether it is on copper, stone or whatever, disease, bhutas, planets, madness, pisacas and the kleshas of the mind can never enter or afflict one. One should do penance at night in a rectangular fire pit, using turmeric mixed with food, sesame, beans, rice, yellow flowers, yellow fruit, Palmyra leaves, together with the letters of the target's name, using ghee. Then one may paralyse, as previously stated. At midnight, the enemy may be felled if one sacrifices in fire in a yoni shaped pit, offering meat in a devoted way and sacrificing sheep, lamb, chicken for the number of days previously stated. One may kill the enemy by disease, sword, dart, serpent, water, flame, elephant, madness, enemies, whirlwind, the fall of a tree or wall, consumed by enemies. The enemies are unable to withstand this prayogas. It is important to note that this description of manipulation of matter towards attainment of Prakruti Kshobha and Prakruti siddhi within the ambit of space time by conscious actions to the subjective world is of utmost importance. Prakruti Siddhi, the positive ramifications have also to be treated in a likewise exulted and exalted way

In excited reveries: Dairy Notes: 21st December 2012:

Teleportation and transmutation is the only way for you!

I told you all pervasive nature of Brahman-Anti Brahman nature!

So?

They are at it here too!

They are pulling!

What?

Space is being pulled because of dark energy!

It is expansion not stretch!

You told me Dark energy is Shiva as well as At Shiva!

Yes! They have to exist together; good and bad cannot be separate!

Shakti is dynamic to static Shiva!

Shakti is power and Shiva is pure consciousness in all its sublime and pristine glory!

I have given models for loss of duality at this stage! Please see!

It is quite clear unless someone from your jamboree, bandwagon and battalion is with them; it is not possible for anyone to break inside your house!

They have already broken in!

Whenever acting in the consciousness of Brahman –Anti Brahman, the performers know they have immunity from law and hence shall do it with impunity!

Yes!

Even they are caught, they are sure they shall be released with the highlight of the loop holes of law!

You see?

What?

It is a misnomer antithetical theory of systems disintegration! World's peace is at stake! All sane and sapient persons must join hands to fight it!

If they are not doing that is!

Heh! Heh!

You mean every one is transformed?

Yes!

There is Brahman and Anti Brahman in every one!

Gods and angels manifest in actions depending upon Tamas, Rajas and sattva proportionalities!

And that proportionality depends upon karma!

Ingenious and prodigious ways to see the prey does not escape at all!

Some people tell things very quickly! Why?

Like?

You were talking about stretching of space! expansions of space due to dark energy!

Well! It somehow came off!

Other People's Pain: Narcissism, Sadism, and Masochism By: Dr. Sam Vaknin http://samvak.tripod.com/covers.jpg for models see 30 E onwards

(1) Most narcissists enjoy an irrational and brief burst of relief after having suffered (e) emotionally ("narcissistic injury") or after having sustained a loss.
(2) It is a sense of freedom, which comes with being unshackled. Having lost everything, the narcissist often feels that he has found(eb) himself, that he has been re-born, that he has been charged(eb) with natal energy, able to take on new challenges and to explore(e&eb) new territories.
(3) This elation is so addictive, that the narcissist often seeks (e) pain, humiliation, punishment, scorn, and contempt - as long as they are public and involve the attention of peers and superiors.
(4) Being punished accords with the tormenting inner voices of the narcissist which keep telling him that he is (=) bad, corrupt, and worthy of penalty.
(5) This is the masochistic streak in the narcissist. But the narcissist is (=) also a sadist - albeit an unusual one.
(6) The narcissist inflicts (eb) pain and abuse on others.
(7) He devalues (e) Sources of Supply, callously and off-handedly abandons them, and discards people, places, partnerships, and friendships unhesitatingly.
(8) Some narcissists - though by no means the majority - actually ENJOY abusing, taunting, tormenting, and freakishly controlling (e&eb) others ("gaslighting"). But most of them do these things absentmindedly, automatically, and, often, even without good reason.

They are mean and small people! How can they control!

Through Supari mafia, crime syndicates, their commission agents who got them clients, hoodlum mugger aggregates who do anything for money, raucous ribaldry congregates and loutish jeers elements!

You mean they do it against their own people/

Yes!

Utch! Utch!!

(9) What is unusual about the narcissist's sadistic behaviours - premeditated (e&eb) acts of tormenting others while enjoying their anguished reactions - is that they are goal orientated.

(10) "Pure" sadists have (e) no goal in mind except the pursuit of pleasure - pain as (=) an art form (remember the Marquis de Sade?).
(11) The narcissist, on the other hand, haunts and hunts his victims for a reason - he wants them to reflect (e&eb) his inner state. It is all part of a mechanism called "Projective Identification".

Aw!

Women do it too?

Certainly!

(12) When the narcissist is angry, unhappy, disappointed, injured, or hurt - he feels unable to express (eb) his emotions sincerely and openly since to do (e) so would be to admit his frailty, his neediness, and his weaknesses.
(13) He deplores (e) his own humanity - his emotions, his vulnerability, his susceptibility, his gullibility, his inadequacies, and his failures.
(14) So, he makes use (e) of other people to express his pain and his frustration, his pent up anger and his aggression.
(15) He achieves this by mentally torturing other people to the point of madness, by driving them (eb) to violence, by reducing (e) them to scar tissue in search of outlet, closure, and, sometimes, revenge.
(16) He forces (eb) people to lose their own character traits - and adopt (e&eb) his own instead.
(17) In reaction to his constant and well-targeted abuse, they become abusive, vengeful, ruthless, lacking empathy, obsessed, and aggressive.
(18) They mirror him faithfully and thus relieve (eb) him of the need to express himself directly.

There is one here! Fits the bill perfectly!

Initiated in to devadasis system at the age of nine, resorting to amorous escapades and extra mural activities for 25 years, later on working as a damsel for a don, a marriage with five kids, a sixty year old women, she wants to live happy married life!

Wow!

It is praise worthy really! You must go on and on until you reach grand limbo of oblivion and lybrintyine abyss never to come back!

There is a custom here to shave their heads off, cut their nose, make them sit on a donkey, and move them south wards!

Heh! Heh!

Laughing?

Donot cut the nose!

(19) Having constructed (eb) this writhing hall of human mirrors, the narcissist withdraws.
(20) The goal achieved, he (=) lets go.
(21) As opposed to the sadist, he is (=) no in it, indefinitely, for the pleasure of it.
(22) He abuses and traumatizes, humiliates and abandons, discards and ignores, insults and provokes - only for the purpose of purging (e) his inner demons.
(23) By possessing others, he purifies (e) himself, cathartically, and exorcises his demented self.

But nobody bothers here!

And one can be narcissist and sadist too!

Then he may not with draw!

Then?

Searches for another clientele!

(24) This accomplished, he acts (e&eb) almost with remorse.
(25) An episode of extreme abuse is followed by(eb) an act of great care and by mellifluous apologies.

Yes! Yes! This creature is like that!

She says she wants to do service to society!

(26) The Narcissistic Pendulum swings between the extremes of torturing others and (e&eb) empathically soothing the resulting pain.
(27) This incongruous behaviour, these "sudden" shifts between sadism and altruism, abuse and "love", ignoring and caring, abandoning and clinging, viciousness and remorse, the harsh and the tender - are, perhaps, the most difficult to comprehend and to accept. These swings produce (eb) in people around the narcissist emotional insecurity, an eroded sense of self-worth, fear, stress, and anxiety ("walking on eggshells").
(28) Gradually, emotional paralysis ensues and they come to occupy the same emotional wasteland inhabited by (eb) the narcissist, his prisoners and hostages in more ways than one - and even when he is long out of their life. **Copyright Notice This material is copyrighted. Consider a terrified face (under conditions such that I do not see and do not experience the causes of this terror). This face expresses a possible world: the terrifying world. By “expression” we mean, as always, that relation which involves a torsion between an expressor and an expressed such that the expressed does not exist apart from the expressor, even though the expressor relates to it as though to something completely different. By “possible”, therefore, we do not mean any resemblance but that state of the implicated or enveloped in its very heterogeneity with what envelops it: the terrified face does not resemble what terrifies it; it envelops a state of the terrifying world. What is action?

Well! You must refer Parsons for that!

Parson’s theory of action systems: Source: Wikipedia

(1) Parsons established action theory in order to integrate the study of social order with (e&eb) the structural and voluntaristic aspects of macro and micro factors.
(2) In other words it may be described as (=) an attempt to maintain the scientific rigour of positivism, while acknowledging the necessity of the "subjective dimension" of human action incorporated in(e) hermeneutic types of sociological theorizing.
(3) Parsons sees motives as (=) part of our actions.
(4) Therefore, he thought that social science must consider ends, purposes and ideals when looking at actions. Parsons placed his discussion within (eb) a higher epistemological and explanatory context of systems theory and cybernetics.

Action theory in Luhmann and Parsons

(5) System theorists such as Niklas Luhmann and Talcott Parsons can be viewed as (=) at least partially antipositivist.
(6) Parsons however was not against positivism as such but against (e) the absolution of positivism.
(7) Parsons shared positivism's desire for a general unified theory, not only for the social science but for the whole realm of action systems (in which Parsons included the concept of "living systems"). Where Parsons departed from the positivists was on the criteria for science. Thus, at least for the social sciences, Parsons maintained that a full and meaningful theory had to include (e) the question of "ultimate values," which by their very nature and definition, included questions of metaphysics and for this and for other reasons, Parsons theory stands at least with one foot in the sphere of hermeneutics and similar spheres of thinking, which somehow become (=) relevant when the question of "ends" need to be considered within systems of action-orientation.
(8) Parsons first major work, The Structure of Social Action (1937) where he discussed the methodological and meta-theoretical premises for his general theory, contained among others an argument for the necessity for an action theory to be based (e) on a voluntaristic foundation and why both a sheer positivistic-utilitarian approach as well as a sheer "idealistic" approach will not satisfy the necessary prerequisites for the foundation of an action-theory (within the realm of the social sciences).
(9) The most metaphysical questions in his theory laid embedded in (eb) the concept of "Constitutive Symbolization," which represented (eb) the pattern maintenance of the cultural system (or the L subsystem of that system).
(10) Later the metaphysical questions became more specified in the Paradigm of the Human Condition, which was an extension of the AGIL-system, which Parsons developed in the years before his death. One of the main differences, which characterized Parsons' approach to Sociology, was the way in which he theoretically specified the fact that cultural objects form(eb) an autonomous type

(11). This is one of the reasons why Parsons established (eb) a careful division between cultural and social system, a point which he highlighted in part through the design of the AGIL paradigm and through various writing, including a short statement which he wrote together with Alfred Kroeber.

(12) The separation of the cultural and social system had various implications for the nature of the basic categories of the cultural system; especially it had implications for the way cognitive capital is (=) perceived as a factor in history.

(13) In contrast to pragmatism, materialism and philosophical and psychological behaviorism (and other anti-Kantian types of epistemological paradigms), which tended to regard the role of cognitive capital as (=) identical with the basic rationalization processes in history

(14) Parsons regarded this question fundamentally different. Cognitive capital, Parsons maintained, is bound to (e&eb) passion and faith and is entangled as promotional factors in rationalization processes but is (=) not absorb or identical with these processes per se.

(15) Whether there exists a high level of integration in a culture or not, is an historical question; but the typical cultural system has (e) generally a comparatively low level of harmony and "order."

(16) Parsons was not a functionalist but an action theorist (he never used the term functionalism about this own theory); his use of the term "structural functionalism" has generally been misunderstood. It does not describe Parsons' theory in any way but was used (e) in a special context to describe a particular stage in the methodological development of the social sciences.

(17) Parsons action theory is characterized by (e) a system-theoretical approach, which integrated a meta-structural analysis with (e&eb) a voluntary theory.

(18) Parsons action theory is characterized by (e) a system-theoretical approach, which integrated a meta-structural analysis with (e&eb) a voluntary theory. Therefore, to discuss action theory under the concept of "functionalism," as so often has been done is to fail to understand Parsons.

Structural functionalism and functional structuralism?

(19) Structural functionalism, or simply functionalism, is (=) a framework for building theory that sees society as a complex system whose parts work together to promote (eb) solidarity and stability.

(20) Structural functionalism, or simply functionalism, is (=) a framework for building theory that sees society as a complex system whose parts work together to promote (eb) solidarity and stability

(21) This approach looks at society through a macro-level orientation, which is a broad focus on the social structures that shape (e&eb) society as a whole, and believes that society has(e) evolved like organisms.

(22) This approach looks at both social structure and social functions. Functionalism addresses society as (=) a whole in terms of the function of its constituent elements; namely norms, customs, traditions, and institutions.

(23) A common analogy, popularized by Herbert Spencer, presents these parts of society as (=) "organs" that work toward the proper functioning of the "body" as a whole.

(24) In the most basic terms, it simply emphasizes (eb) “the effort to impute, as rigorously as possible, to each feature, custom, or practice, its effect on the functioning of a supposedly stable, cohesive system".

(25) For Talcott Parsons, "structural-functionalism" came to describe (eb) a particular stage in the methodological development of social science, rather than a specific school of thought.

(26) The structural functionalism approach is (=) a macro sociological analysis, with a broad focus (e) on social structures that shape society as a whole.

Theory

Classical theories are defined by a tendency towards biological analogy and notions of social evolutionism:

(27) Functionalist thought, from Comte onwards, has looked particularly towards biology as (=) the science providing the closest and most compatible model for social science.

(28) Biology has been taken to provide (eb) a guide to conceptualizing the structure and the function of social systems and to analyzing processes of evolution via (e&eb) mechanisms of adaptation ... functionalism strongly emphasises the pre-eminence (e) of the social world over its individual parts (i.e. its constituent actors, human subjects). —Anthony Giddens, The Constitution of Society 1984

(29) Biology has been taken to provide (eb) a guide to conceptualizing the structure and the function of social systems and to analyzing processes of evolution via (e&eb) mechanisms of adaptation ... functionalism strongly emphasises the pre-eminence (e) of the social world over its individual parts (i.e. its constituent actors, human subjects). —Anthony Giddens, The Constitution of Society 1984

(30) Biology has been taken to provide (eb) a guide to conceptualizing the structure and the function of social systems and to analyzing processes of evolution via (e&eb) mechanisms of adaptation ... functionalism strongly emphasises the pre-eminence (e) of the social world over its individual parts (i.e. its constituent actors, human subjects). —Anthony Giddens, The Constitution of Society 1984

(31) Whilst one may regard functionalism as (=) a logical extension of the organic analogies for society presented by political philosophers such as Rousseau, sociology draws firmer attention to (eb) those institutions unique to industrialized capitalist society (or modernity).

(32) Functionalism also has (e) an anthropological basis in the work of theorists such as Marcel Mauss, Bronisław Malinowski and Radcliffe-Brown. It is in Radcliffe-Brown's specific usage that the prefix 'structural' emerged.

Émile Durkheim

(33) Radcliffe-Brown proposed that most stateless, "primitive" societies, lacking strong centralized institutions, are based (e) on an association of corporate-descent groups.

(34) Structural functionalism also took on Malinowski's argument that the basic building block of society is (=) the nuclear family and that the clan is an outgrowth, not vice versa.

(35) Émile Durkheim was concerned with the question of how certain societies maintain (e&eb) internal stability and survive over time.

(36) He proposed that such societies tend to be segmented, with equivalent parts held together (e&eb) by shared values, common symbols or, as his nephew Marcel Mauss held, systems of exchanges.

(37) Durkheim used the term 'mechanical solidarity' to refer to these types of "social bonds based on (e) common sentiments & shared moral values, which are strong among members of pre-industrial societies".

(38) In modern, complicated societies, members perform very different tasks, resulting in (eb) a strong interdependence.

(39) Based on the metaphor above of an organism in which many parts function together to sustain the whole, Durkheim argued that complicated societies are held together by (e&eb) organic solidarity, i.e. "social bonds, based on (e) specialization and interdependence, which are strong among members of industrial societies".

(40) Based on the metaphor above of an organism in which many parts function together to sustain the whole, Durkheim argued that complicated societies are held together by (e&eb) organic solidarity, i.e. "social bonds, based on (e) specialization and interdependence, which are strong among members of industrial societies".

(41) These views were upheld by Durkheim, who, following Comte, believed that society constitutes (e) a separate "level" of reality, distinct from both biological and inorganic matter.

(42) Explanations of social phenomena had therefore to be constructed within (eb) this level, individuals being merely transient (e) occupants of comparatively stable social roles.

(43) The central concern of structural functionalism is (=) a continuation of the Durkheim and task of explaining the apparent stability and internal cohesion needed by (e) societies to endure over time.

(44) Societies are seen as (=) coherent, bounded and fundamentally relational constructs that function like organisms, with their various (or social institutions) working together in an (eb) unconscious, quasi-automatic fashion toward achieving (eb) an overall social equilibrium.

(45) Societies are seen as (=) coherent, bounded and fundamentally relational constructs that function like organisms, with their various (or social institutions) working together in an (eb) unconscious, quasi-automatic fashion toward achieving (eb) an overall social equilibrium

(46) All social and cultural phenomena are therefore seen as (=) functional in the sense of working together, and are effectively deemed to have (e) "lives" of their own.

(47) All social and cultural phenomena are therefore seen as (=) functional in the sense of working together, and are effectively deemed to have (e) "lives" of their own

(48) They are primarily analyzed in terms of this function. The individual is significant not in and of himself, but rather in terms (e&eb) of his status, his position in patterns of social relations, and the behaviours associated with his status.

(49) Therefore, the social structure is (=) the network of statuses connected by associated roles.

(50) It is simplistic to equate the perspective directly with (=) political conservatism.

(51) The tendency to emphasise "cohesive systems", however, leads functionalist theories to be contrasted (e&eb) with "conflict theories" which instead emphasize (eb) social problems and inequalities.

Auguste Comte

(52) Auguste Comte, the "Father of Positivism", pointed out the need (e) to keep society unified as many traditions were diminishing. He was the first person to coin the term sociology. Auguste Comte suggests that sociology is the product of a three-stage development.

(53) Theological Stage: From the beginning of human history until the end of the European Middle Ages, people took a religious view that society expressed (eb) God's will. In the theological state, the human mind, seeking the essential nature of beings, the first and final causes (the origin and purpose) of all effects—in short, absolute knowledge—supposes all phenomena to be produced by (e) the immediate action of supernatural beings.

(54) Metaphysical Stage: People began seeing society as (=)a natural system as opposed to the supernatural. Began with the Enlightenment and the ideas of Hobbes, Locke, and Rousseau.

(55) Reflected (e&eb) the failings of a selfish human nature rather than the perfection of God.

(56) Scientific Stage: Describing society through the application of (e&eb) the scientific approach, this draws on the work of scientists.

Herbert Spencer

(57) Herbert Spencer (1820–1903), a British philosopher famous for applying the theory of natural selection (e&eb) to society.

(58) He was in many ways the first true sociological functionalist In fact, while Durkheim is widely considered the most important functionalist among positivist theorists, it is well known that much of his analysis was culled from reading Spencer's work, especially his Principles of Sociology (1874–96). Spencer allude society to the analogy of human body. Just as the structural parts of the human body - the skeleton, muscles, and various internal organs - function independently to help (e) the entire organism survive, social structures work together to preserve society.

(59) While most avoid the tedious tasks of reading Spencer's massive volumes (filled as they are with long passages explicating the organic analogy, with reference to cells, simple organisms, animals, humans and society), there are some important insights that have quietly influenced many contemporary theorists, including Talcott Parsons, in his early work "The Structure of Social Action" (1937). Cultural anthropology also consistently uses functionalism. This evolutionary model, unlike most 19th century evolutionary theories, is cyclical, beginning with the differentiation and increasing (e&eb) complication of an organic or

"super-organic" (Spencer's term for a social system) body, followed by a fluctuating state of equilibrium and disequilibrium (or a state of adjustment and adaptation), and, finally, the stage of disintegration or dissolution.

(60) Following Thomas Malthus' population principles, Spencer concluded that society is (=) constantly facing selection pressures (internal and external) that force it to adapt its internal structure through (e&eb) differentiation.

(61) Following Thomas Malthus' population principles, Spencer concluded that society is (=) constantly facing selection pressures (internal and external) that force it to adapt its internal structure through (e&eb) differentiation.

(62) Every solution, however, causes (eb)a new set of selection pressures that threaten society's viability. It should be noted that Spencer was not a determinist in the sense that he never said that

(63) Selection pressures will be felt in time to change(e&eb) them;

(64) They will be (=) felt and reacted to; or

(65) The solutions will (=) always work.

(66) In fact, he was in many ways a political sociologist, and recognized that the degree of centralized and consolidated authority in a given polity could make or break (e&eb) its ability to adapt.

(67) In other words, he saw a general trend towards the centralization of power as leading to (eb) stagnation and ultimately, pressures to decentralize.

Creation and annihilation operators for reaction-diffusion equations (Source: Wikipedia)

(69) The annihilation and creation operator description has also been useful (e) to analyze classical reaction diffusion equations, such as the situation when a gas of molecules

(70) A diffuse and interact on contact, forming (eb) an inert product: A + A → ∅.

(71) To see how this kind of reaction can be described by (e) the annihilation and creation operator formalism, consider $n_i$particles at (eb) a site i on a 1-d lattice.

(72) Each particle diffuses independently; so that the probability that one of them leaves the site for short times dt is(=) proportional to $n_i dt$, say $\alpha n_i dt$ to hop left and $\alpha n_i dt$ to hop right.

(73) All n particles (individuals) will stay put with a probability $1-2\alpha n_i dt$.

(74) We can now describe the occupation of particles on the lattice as (=) a `ket' of the form | n1, n2, ... ⟩.

(75) A slight modification (e&eb) of the annihilation and creation operators is needed so that

$$a|n\rangle = \sqrt{n}\ |n-1\rangle$$

and

$$a^\dagger|n\rangle = \sqrt{n+1}\ |n+1\rangle.$$

(76) This modification preserves (eb) the commutation relation

$$[a, a^\dagger] = 1,$$

but allows us to write the pure diffusive behaviour of the particles as(=)

$$\partial_t|\psi\rangle = -\alpha\sum\left(2a_i^\dagger a_i - a_{i-1}^\dagger a_i - a_{i+1}^\dagger a_i\right)|\psi\rangle = -\alpha\sum\left(a_i^\dagger - a_{i-1}^\dagger\right)\left(a_i - a_{i-1}\right)|\psi\rangle$$

(77) The reaction term can be deduced by noting that n particles can interact in $n(n-1)$ different ways, so that the probability that a pair annihilates is (=) $\lambda n(n-1)dt$ and the probability that no pair annihilates is $1-\lambda n(n-1)dt$ leaving us with a term

$$\lambda \sum (a_i a_i - a_i^\dagger a_i^\dagger a_i a_i)$$

Yielding (eb)

$$\partial_t |\psi\rangle = -\alpha \sum (a_i^\dagger - a_{i-1}^\dagger)(a_i - a_{i-1})|\psi\rangle + \lambda \sum (a_i^2 - a_i^{\dagger 2} a_i^2)|\psi\rangle$$

Other kinds of interactions can be included in a similar manner.

(78) This kind of notation allows the use of quantum field theoretic techniques to be used(e) in the analysis of reaction diffusion systems.

Creation and annihilation operators in quantum field theories

Second quantization and Quantum_field_theory#Second_quantization

(79) In quantum field theories and many-body problems one works with creation and annihilation operators of quantum states, $a_i^\dagger$ and a_i. These operators change (e&eb)the eigenvalues of the number operator,

$$N = \sum_i n_i = \sum_i a_i^\dagger a_i$$

,

by one, in analogy to the harmonic oscillator.

(80) The indices (such as i) represent (eb) quantum numbers that label the single-particle states of the system; hence, they are not necessarily single numbers.

(81) For example, a tuple of quantum numbers (n, l, m, s) is used (e) to label states in the hydrogen atom.

(82) The commutation relations of creation and annihilation operators in a multiple-boson system are (=)

$$[a_i, a_j^\dagger] \equiv a_i a_j^\dagger - a_j^\dagger a_i = \delta_{ij},$$

$$[a_i^\dagger, a_j^\dagger] = [a_i, a_j] = 0,$$

Here $[\ ,\ ]$ is the commutator and δ_{ij} is the Kronecker delta.

(83) For fermions, the commutator is replaced (e&eb)by the anticommutator $\{\ ,\ \}$,

$$\{a_i, a_j^\dagger\} \equiv a_i a_j^\dagger + a_j^\dagger a_i = \delta_{ij},$$

$$\{a_i^\dagger, a_j^\dagger\} = \{a_i, a_j\} = 0.$$

(84) Therefore, exchanging disjoint (i.e. $i \neq j$) operators in a product of creation of annihilation operators will reverse (e&eb) the sign in fermion systems, but not in boson systems.

Parson's theory of action systems: Source: Wikipedia

(85) More specifically, Spencer recognized three functional needs or prerequisites that produce (eb) selection pressures: they are regulatory, operative (production) and distributive.

(86) He argued that all societies need to solve problems of control and coordination, production (e&eb) of goods, services and ideas, and, finally, to find ways of distributing these resources.

(87) Initially, in tribal societies, these three needs are inseparable, and the kinship system is (=) the dominant structure that satisfies them.

(88) As many scholars have noted, all institutions are subsumed (e) under kinship organization, but, with increasing population (both in terms of sheer numbers and density), problems emerge (eb) with regard to feeding individuals, creating new forms of organization — consider the emergent division of labour —, coordinating and controlling various differentiated social units, and developing systems of resource distribution.

(89) The solution, as Spencer sees it, is to differentiate structures to fulfill more specialized functions; thus a chief or "big man" emerges (eb) soon followed by a group of lieutenants, and later kings and administrators.

(90) The structural parts of society (ex. families, work) function interdependently to help society function. Therefore, social structures work together (e&eb) to preserve society

(91) Perhaps Spencer's greatest obstacle that is being widely discussed in modern sociology is the fact that much of his social philosophy is rooted in (e) the social and historical context of Ancient Egypt.

(92) He coined the term "survival of the fittest" in discussing the simple fact that small tribes or societies tend to be defeated or conquered by larger ones. Of course, many sociologists still use him (knowingly or otherwise) in their analyses, especially due (e) to the recent re-emergence of evolutionary theory.

Talcott Parsons

(93) Talcott Parsons was heavily influenced by Émile Durkheim and Max Weber, synthesizing much of their work into his action theory, which he based (e) on the system-theoretical concept and the methodological principle of voluntary action.

(94) He held that "the social system is (=) made up of the actions of individuals."

(95) His starting point, accordingly, is the interaction between two individuals faced with a variety of choices about how they might act, choices that are influenced and constrained by (e&eb) a number of physical and social factors.

(96) Parsons determined that each individual has(e) expectations of the other's action and reaction to his own behaviour, and that these expectations would (if successful) be "derived" from (e)the accepted norms and values of the society they inhabit.

(97) As Parsons himself emphasized, in a general context there would never exist any perfect "fit" between behaviours and norms, so such a relation is (=) never complete or "perfect."

(98) Social norms were always problematic for Parsons, who never claimed (as has often been alleged) that social norms were generally accepted and agreed upon, should this prevent (e) some kind of universal law. Whether social norms were accepted or not was for Parsons simply a historical question.

(99) As behaviours are repeated in more interactions, and these expectations are entrenched or institutionalized, a role is created. Parsons defines (eb) a "role" as the normatively-regulated participation "of a person in a concrete process of social interaction with specific, concrete role-partners."

(100) Although any individual, theoretically, can fulfill any role, the individual is (=) expected to conform to the norms governing the nature of the role they fulfill.

(101) Furthermore, one person can and does fulfill many different roles at the same time. In one sense, an individual can be seen to be (=) a "composition" of the roles he inhabits.

(102) Certainly, today, when asked to describe themselves, most people would answer with reference (e&eb) to their societal roles.

(103) Parsons later developed the idea of roles into collectivities of roles that complement (e&eb) each other in fulfilling functions for society.

(104) Some roles are bound up in institutions and social structures (economic, educational, legal and even gender-based). These are functional in the sense that they assist (eb) society in operating and fulfilling its functional needs so that society runs smoothly.

(105) Contrary to prevailing myth, Parsons never spoke about a society where there was (=) no conflict or some kind of "perfect" equilibrium.

(106) A society's cultural value-system was (=) in the typical case never completely integrated, never static and most of the time, like in the case of the American society in a complex state of transformation relative (e&eb) to its historical point of departure.

(107) To reach a "perfect" equilibrium was not any serious theoretical question in Parsons analysis of social systems, indeed, the most dynamic societies had (e) generally cultural systems with important inner tensions like the US and India.

(108) These tensions were (quite often) (=) a source of their strength according to Parsons rather than the opposite.

(109) Parsons never thought about system-institutionalization and (e&eb) the level of strains (tensions, conflict) in the system as opposite forces per se.

(110) The key processes for Parsons for system reproduction are (=) socialization and social control.

(111) Socialization is important because (e) it is the mechanism for transferring the accepted norms and values of society to the individuals within the system.

(112) Parsons never spoke about "perfect socialization"—in any society socialization was (=) only partial and "incomplete" from an integral point of view.

(113) Parsons states that "this point [...] is independent of the sense in which [the] individual is (=) concretely autonomous or creative rather than 'passive' or 'conforming', for individuality and creativity, are to a considerable extent, phenomena of the institutionalization of expectations"; they are culturally constructed.

(114) Socialization is supported by (e) the positive and negative sanctioning of role behaviours that do or do not meet these expectations.

(115) A punishment could be informal, like a (=) snigger or gossip, or more formalized, through institutions such as prisons and mental homes.

(116) If these two processes were perfect, society would become (=) static and unchanging, but in reality this is unlikely to occur for long.

(117) Parsons recognizes this, stating that he treats "the structure of the system as (=) problematic and subject to change,"

(118) His concept of the tendency towards equilibrium "does not (e) imply the empirical dominance of stability over change."

(119) He does, however, believe that these changes occur (eb) in a relatively smooth way.

(120) Individuals in interaction with changing situations adapt (e&eb) through a process of "role bargaining."

(121) Once the roles are established, they create (eb) norms that guide further action and are thus institutionalised, creating (eb) stability across social interactions. Same thing is true in physics also.

(122) Where the adaptation process cannot adjust, due to sharp shocks or immediate radical change, structural dissolution occurs and either new structures (or therefore a new system) are formed, or society dies. This model of social change has been described as a "moving equilibrium," and emphasises a desire for social order.

Davis and Moore

(123) Kingsley Davis and Wilbert E. Moore (1945) gave an argument for social stratification based (e) on the idea of "functional necessity" (also known as the Davis-Moore hypothesis).

(124) They argue that the most difficult jobs in any society have (e) the highest incomes in order to motivate individuals to fill the roles needed by the division of labour. Thus inequality serves social stability.

(125) This argument has been criticized as fallacious from a number of different angles: the argument is both that the individuals who are the most deserving are the highest rewarded, and that a system of unequal rewards is (=) necessary, otherwise no individuals would perform as needed for the society to function.

(126) The problem is that these rewards are supposed to be based upon (e) objective merit, rather than subjective "motivations."

(127) The argument also does not clearly establish why some positions are worth more than others, even when they benefit more people in society, e.g., teachers compared to athletes and movie stars. Critics have suggested that structural inequality (inherited wealth, family power, etc.) is (=) itself a cause of individual success or failure, not a consequence of it.

Robert Merton

(128) Robert K. Merton made important refinements to functionalist thought. He fundamentally agreed with Parsons' theory. However, he acknowledged that it was problematic, believing that it was over generalized [Holmwood, 2005:100]. Merton tended to emphasize (eb) middle range theory rather than a grand theory, meaning that he was able to deal specifically with some of the limitations in Parsons' theory.

(129) Merton believed that any social structure probably has many functions, some more (eb) obvious than others.

(130) He identified 3 main limitations: functional unity, universal functionalism and indispensability [Ritzer in Gingrich, 1999].

(131) He also developed the concept of deviance and made (eb) the distinction between manifest and latent functions.

(132) Manifest functions referred to the recognized and intended consequences of (e) any social pattern. Latent functions referred to unrecognized and unintended consequences of any social pattern.

(133) Merton criticized functional unity, saying that not all parts of a modern complex society work for (e) the functional unity of society.

(134) Consequently, there is a social dysfunction referred to as any social pattern that may disrupt (e&eb) the operation of society.

(135) Some institutions and structures may have other functions, and some may even be generally dysfunctional, or be functional for some while being dysfunctional for others. This is because (e) not all structures are functional for society as a whole.

(136) Some practices are (=) only functional for a dominant individual or a group [Holmwood, 2005:91]

(137) There are two types of functions that Merton discusses the "manifest functions" in that a social pattern can trigger (eb) a recognized and intended consequence.

(138) The manifest function of education includes (e) preparing for a career by getting good grades, graduation and finding good job.

(139) The second type of function is (=) "latent functions", where a social pattern results in an unrecognized or unintended consequence.

(140) The latent functions of education include meeting new people, extra-curricular activities, and school trips. Another type of social function is "social dysfunction" which is (=) any undesirable consequences that disrupts the operation of society.

(141) The social dysfunction of education includes (e) not getting good grades, a job.

(142) Merton states that by recognizing and examining the dysfunctional aspects of society we can explain (eb) the development and persistence of alternatives.

(143) Thus, as Holmwood states, "Merton explicitly made power and conflict central issues for (e) research within a functionalist paradigm" [2005:91].

(144) Merton also noted that there may be functional alternatives to (e) the institutions and structures currently fulfilling the functions of society.

(145) This means that the institutions that currently exist are (=) not indispensable to society.

(146) Merton states "just as the same item may have (e) multiple functions, so may the same function be diversely fulfilled by (e) alternative items" [cited in Holmwood, 2005:91].

(147) This notion of functional alternatives is important because (e) it reduces the tendency of functionalism to imply approval of the status quo.

(148) Merton's theory of deviance is derived from (e) Durkheim's idea of anomie.

(149) It is central in explaining how internal changes (e&eb) can occur in a system.

(150) For Merton, anomie means a discontinuity between cultural goals and (e&eb) the accepted methods available for reaching them.

(151) Merton believes that there are 5 situations facing an actor. Conformity occurs when an individual has the means and desire to achieve (eb) the cultural goals socialized into him.

(152) Innovation occurs when an individual strives to attain the accepted cultural goals but chooses (e&eb) to do so in novel or unaccepted method.

(153) Ritualism occurs when an individual continues to do things as proscribed (e)by society but forfeits the achievement of the goals.

(154) Retreatism is (=) the rejection of both the means and the goals of society.

(155) Rebellion is a combination of the rejection of societal goals and (e&eb) means and a substitution of other goals and means.

(156) Thus it can be seen that change can occur (eb) internally in society through either innovation or rebellion.

(157) It is true that society will attempt to control (e&eb) these individuals and negate the changes, but as the innovation or rebellion builds momentum, society will eventually adapt or face dissolution.

Almond and Powell

(158) In the 1970s, political scientists Gabriel Almond and Bingham Powell introduced a structural-functionalist approach to (e&eb) comparing political systems.

(159) They argued that, in order to understand a political system, it is necessary (e) to understand not only its institutions (or structures) but also their respective functions.

(160) They also insisted that these institutions, to be properly understood, must be placed in (eb) a meaningful and dynamic historical context.

(161) This idea stood in marked contrast (e&eb) to prevalent approaches in the field of comparative politics — the state-society theory and the dependency theory.

(162) These were the descendants of David Easton's system theory in international relations, a mechanistic view that saw all political systems as essentially the same, subject (e) to the same laws of "stimulus and response" — or inputs and outputs — while paying little attention to unique characteristics.

(163) The structural-functional approach is based (e) on the view that a political system is made up of several key components, including interest groups, political parties and branches of government. **It looks this is true in physics too.**

(164) In addition to structures, Almond and Powell showed that a political system consists (e) of various functions, chief among them political socialization, recruitment and communication

(165) socialization refers (eb) to the way in which societies pass along their values and beliefs to succeeding generations, and in political terms describe the process by which a society inculcates civic virtues, or the habits of effective citizenship;

(166) Recruitment denotes the process by which a political system generates (eb) interest, engagement and participation from citizens

(167) Communication refers (eb) to the way that a system promulgates its values and information.

Structural functionalism and unilineal descent

(168) In their attempt to explain the social stability of African "primitive" stateless societies where they undertook their fieldwork, Evans-Pritchard (1940) and Meyer Fortes (1945) argued that the Tallensi and the Nuer were primarily organized around (e&eb) unilineal descent groups.

(169) Such groups are characterized by (e) common purposes, such as administering property or defending against attacks

(170) They form a permanent social structure that persists (eb) well beyond the lifespan of their members.

(171) In the case of the Tallensi and the Nuer, these corporate groups were based (e) on kinship which in turn fitted into the larger structures of unilineal descent

Decline of functionalism

(172) third 'generation' of social theory includes (e) phenomenologically inspired approaches, critical theory, ethnomethodology, symbolic interactionism, structuralism, post-structuralism, and theories written in the tradition of hermeneutics and ordinary language philosophy

(173) While absent from empirical sociology, functionalist themes remained detectable in sociological theory, most notably in the works of Luhmann and Giddens. There are, however, signs of an incipient revival, as functionalist claims have recently been bolstered by (eb) developments in multilevel selection theory and in empirical research on how groups solve social dilemmas.

(174) Recent developments in evolutionary theory — especially by biologist David Sloan Wilson and anthropologists Robert Boyd and Peter Richerson — have provided (eb) strong support for structural functionalism in the form of multilevel selection theory.

(175) In this theory, culture and social structure are (=) seen as a Darwinian (biological or cultural) adaptation at the group level.

Conflict theory and Critical theory

(176) In the 1960s, functionalism was criticized for being unable to account for (e) social change, or for structural contradictions and conflict (and thus was often called "consensus theory").

(177) Also, it ignores inequalities including race, gender, class, which causes tension and conflict. The refutation of the second criticism of functionalism, that it is static and has no concept of change, has already been articulated above, concluding that while Parsons' theory allows (eb) for change, it is an orderly process of change [Parsons, 1961:38], a moving equilibrium.

(178) Therefore referring to Parsons' theory of society as static is (=) inaccurate.

(179) It is true that it does place emphasis (eb) on equilibrium and the maintenance or quick return to social order, but this is a product of the time in which Parsons was writing (post-World War II, and the start of the cold war).

(180) Society was in upheaval and fear abounded. At the time social order was crucial, and this is reflected in Parsons' tendency to promote (eb) equilibrium and social order rather than social change.

(181) Furthermore, Durkheim favored a radical form of guild socialism along with (e&eb) functionalist explanations.

(182) Also, Marxism, while acknowledging social contradictions, still uses (e) functionalist explanations.

(183) Parsons' evolutionary theory describes (eb) the differentiation and reintegration systems and subsystems and thus at least temporary conflict before reintegration (ibid).

(184) "The fact that functional analysis can be seen by some as (=) inherently conservative and by others as inherently radical suggests (eb) that it may be inherently neither one nor the other." (Merton 1957: 39)

(185) "The fact that functional analysis can be seen by some as (=) inherently conservative and by others as inherently radical suggests (eb) that it may be inherently neither one nor the other." (Merton 1957: 39)

(186) Stronger criticisms include the epistemological argument that functionalism is (=) tautologous, that is it attempts to account for (e) the development of social institutions solely through recourse (e&eb) to the effects that are attributed to them and thereby explains the two circularly.

(187) However, Parsons drew (e) directly on many of Durkheim's concepts in creating his theory.

(188) Certainly Durkheim was one of the first theorists to explain (eb) a phenomenon with reference to the function it served for society.

(189) He said, "the determination of function is…necessary (e) for the complete explanation of the phenomena" [cited in Coser, 1977:140].

(190) However Durkheim made a clear distinction between historical and functional analysis, saying, "When…the explanation of a social phenomenon is undertaken, we must seek separately (e&eb) the efficient cause which produces it and the function it fulfills" [cited in Coser, 1977:140].

(191) If Durkheim made this distinction, then it is unlikely that Parsons did not. However Merton does explicitly state that functional analysis does not (e) seek to explain why the action happened in the first instance, but why it continues or is reproduced.

(192) He says that "latent functions …go far towards explaining (eb) the continuance of the pattern" [cited in Elster, 1990:130, emphasis added].

(193) Therefore it can be argued that functionalism does not explain the original cause of a phenomenon with reference to its effect, and is therefore, not teleological.

(194) Another criticism describes the ontological argument that society cannot have "needs" as a human being does, and even if society does have needs they need not be met. Anthony Giddens argues that functionalist explanations may all be rewritten as (=) historical accounts of individual human actions and consequences (see Structuration).

(195) A further criticism directed at functionalism is that it contains (e) no sense of agency, that individuals are seen as puppets, acting as their role requires.

(196) Yet Holmwood states that the most sophisticated forms of functionalism are based on (e) "a highly developed concept of action" [2005:107], and as was explained above, Parsons took as his starting point the individual and their actions.

(197) His theory did not however articulate how these actors exercise their agency in opposition (e&eb) to the socialization and inculcation of accepted norms.

(198) As has been shown above, Merton addressed (e) this limitation through his concept of deviance, and so it can be seen that functionalism allows (eb) for agency.

(199) It cannot, however, explain why individuals choose (e&eb) to accept or reject the accepted norms, why and in what circumstances they choose (e&eb) to exercise their agency, and this does remain a considerable limitation of the theory. **(see my models on freewill and destiny)**

(200) Conflict theorists criticised functionalism's concept of systems as (=) giving far too much weight to integration and consensus, and neglecting (e) independence and conflict [Holmwood, 2005:100]. Lockwood [in Holmwood, 2005:101], in line with conflict theory, suggested that Parsons' theory missed the concept of system contradiction.

(201) He did not account for (e) those parts of the system that might have (e) tendencies to Mal-integration.

(202) According to Lockwood, it was these tendencies that come to the surface (eb) as opposition and conflict among actors.

(203) However Parsons thought that the issues of conflict and (e&eb) cooperation were very much intertwined and sought to account for both in his model [Holmwood, 2005:103].

(204) In this however he was limited by his analysis of an 'ideal type' of society which was (=) characterized by consensus.

(205) Merton, through his critique of functional unity, introduced into (eb) functionalism an explicit analysis of tension and conflict.

(206) Marxism which was revived soon after the emergence of conflict theory, criticized professional sociology (functionalism and conflict theory alike) for being partisan to advanced welfare capitalism [Holmwood, 2005:103]. Gouldner [in Holmwood, 2005:103] thought that Parsons' theory specifically was (=) an expression of the dominant interests of welfare capitalism, that it justified institutions with reference to the function they fulfill for society.

(207) It may be that Parsons' work implied or articulated (eb) that certain institutions were necessary to fulfill the functional prerequisites of society, but whether or not this is the case, Merton explicitly states (eb) that institutions are(=) not indispensable and that there are functional alternatives.

(208) It may be that Parsons' work implied or articulated (eb) that certain institutions were necessary to fulfill the functional prerequisites of society, but whether or not this is the case, Merton explicitly states (eb) that institutions are(=) not indispensable and that there are functional alternatives

(209) It may be that Parsons' work implied or articulated (eb) that certain institutions were necessary to fulfill the functional prerequisites of society, but whether or not this is the case, Merton explicitly states (eb) that institutions are(=) not indispensable and that there are functional alternatives

(210) That he does not identify any alternatives to the current institutions does reflect (e&eb) a conservative bias, which as has been stated before is (=) a product of the specific time that he was writing in.

(211) As functionalism's prominence was ending, feminism was on the rise, and it attempted a radical criticism of functionalism. It believed that functionalism neglected (e) the suppression of women within the family structure. Holmwood [2005:103] shows, however, that Parsons did in fact describe the situations where tensions and conflict existed or were about to take place, even if he did not articulate those conflicts.

(212) Some feminists agree, suggesting that Parsons' provided (eb) accurate descriptions of these situations. [Johnson in Holmwood, 2005:103].

(213) On the other hand, Parsons recognized that he had oversimplified (e) his functional analysis of women in relation to work and the family, and focused on the positive functions of the family for society and not on its dysfunctions for women.

(214) Merton, too, although addressing situations where function and dysfunction occurred simultaneously, lacked (e) a "feminist sensibility" [Holmwood, 2005:103].

(215) Postmodernism, as a theory, is (=) critical of claims of objectivity.

(216) Jeffrey Alexander (1985) sees functionalism as (=) a broad school rather than a specific method or system, such as Parsons, who is (=) capable of taking equilibrium (stability) as a reference-point rather than assumption and treats structural differentiation as (=) a major form of social change.

(217) Jeffrey Alexander (1985) sees functionalism as (=) a broad school rather than a specific method or system, such as Parsons, who is (=) capable of taking equilibrium (stability) as a reference-point rather than assumption and treats structural differentiation as (=) a major form of social change

(219) "The name 'functionalism' implies (eb) a difference of method or interpretation that does not exist." (Davis 1967: 401)

(220) This removes the determinism criticized above. Cohen argues that rather than needs a society has (e) dispositional facts: features of the social environment that support the existence of particular social institutions but do not cause them.

Freud's Personality Structures: Source: Wikipedia:

(221) Id, ego and super-ego are the three parts of the psychic apparatus defined in Sigmund Freud's structural model of the psyche; they are the three theoretical constructs in terms (e&eb) of whose activity and interaction mental life is described.

(222) According to this model of the psyche, the id is (=) the set of uncoordinated instinctual trends

(223) The super-ego plays (e&eb) the critical and moralizing role

(224) Ego is the organized, realistic part that mediates between the desires of the id and (e&eb) the super-ego.

(225) The super-ego can stop (e) you from doing certain things that your id may want you to do.

(226) Even though the model is structural and makes reference to an apparatus, the id, ego and super-ego are (=) functions of the mind rather than parts of the brain and do not correspond one-to-one with actual somatic structures of the kind dealt with by neuroscience.

(227) The concepts themselves arose at a late stage in the development of Freud's thought: the "structural model" (which succeeded his "economic model" and "topographical model") was first discussed in his 1920 essay Beyond the Pleasure Principle and was formalized and elaborated upon three years later in his The Ego and the Id. Freud's proposal was influenced by (e&eb) the ambiguity of the term "unconscious" and its many conflicting uses.

Id

(228) The id (German: Es) is the unorganized part of the personality structure that contains (e) a human's basic, instinctual drives.

(229) Id is the only component of personality that is (=) present from birth.

(230) It is the source (e) of our bodily needs, wants, desires, and impulses, particularly our sexual and aggressive drives.

(231) The id contains (e) the libido, which is (=) the primary source of instinctual force that is (=) unresponsive to the demands of reality.

(232) The id contains (e) the libido, which is (=) the primary source of instinctual force that is (=) unresponsive to the demands of reality

(233) The id contains (e) the libido, which is (=) the primary source of instinctual force that is (=) unresponsive to the demands of reality

(234) The id acts according to the "pleasure principle"—the psychic force that motivates the tendency to seek immediate gratification of any impulse—defined as, (eb) seeking to avoid pain or unpleasure (not 'displeasure') aroused by increases in instinctual tension.

(235) If the mind was solely guided by the id, individuals would find it difficult to wait patiently at a restaurant, while feeling hungry, and would most likely grab(e) food from neighbouring tables.

According to Freud the id is unconscious by definition:

(236) "It is the dark, inaccessible part of our personality, what little we know of it we have learned from (e) our study of the Dreamwork and of the construction of neurotic symptoms,

(237) And most of that is (=) of a negative character and can be described only as (=) a contrast to the ego.

(238) We approach the id with analogies: we call it a chaos, a cauldron full of seething excitations. ... It is filled with energy reaching it (eb) from the instincts, but it has no organization, produces (eb) no

collective will, but only a striving to bring about (eb) the satisfaction of the instinctual needs subject to the observance of the pleasure principle."

(239) We approach the id with analogies: we call it a chaos, a cauldron full of seething excitations. ... It is filled with energy reaching it (eb) from the instincts, but it has no organization, produces (eb) no collective will, but only a striving to bring about (eb) the satisfaction of the instinctual needs subject to the observance of the pleasure principle."

(240) We approach the id with analogies: we call it a chaos, a cauldron full of seething excitations. ... It is filled with energy reaching it (eb) from the instincts, but it has no organization, produces (eb) no collective will, but only a striving to bring about(eb) the satisfaction of the instinctual needs subject to the observance of the pleasure principle."

In the id,

(241) "Contrary impulses exist side by side, without (e) cancelling each other out. ...

(242) There is nothing in the id that could be compared (e&eb) with negation

(243) ... Nothing in the id which corresponds (e&eb) to the idea of time."

(244) Developmentally, the id precedes (e) the ego; i.e., the psychic apparatus begins, at birth, as (=) an undifferentiated id, part of which then develops (eb) into a structured ego.

(245) Thus, the id: "contains everything that is inherited, that is present at birth, is (=) laid down in the constitution—above all, therefore, the instincts, which originate from (e) the somatic organization, and which find a first psychical expression here (in the id) in (eb) forms unknown to us."

(246) The mind of a newborn child is (=) regarded as completely "id-ridden", in the sense that it is (=) a mass of instinctive drives and impulses, and needs (e) immediate satisfaction, a view which equates a newborn child with(=) an id-ridden individual—often humorously—with this analogy: an alimentary tract with no sense of responsibility at either end, paraphrasing a quip made by former U.S. President Ronald Reagan during his 1965 campaign for Governor of California in which he compared government to a baby.

(247) The id "knows (e) no judgements of value: no good and evil, no morality.

(248) Instinctual cathexes seeking discharge—that, in our view, is all there is in the id."It is regarded as (=) "the great reservoir of libido", the instinctive drive (eb) to create—the life instincts that are crucial to pleasurable survival.

(249) Alongside the life instincts came the death instincts—the death drive which Freud articulated relatively late in his career in "the hypothesis of a death instinct, the task of which is (=) to lead organic life back into the inanimate state."

(250) For Freud, "the death instinct would thus seem to express (eb) itself—though probably only in part—as an instinct of destruction directed against (e&eb) the external world and other organisms": through aggression.

(251) Freud considered that "the id, the whole person ... originally includes all the instinctual impulses ... the destructive instinct as well." As Eros or the life instincts.

Ego

(252) The ego (German: Ich) acts according to the reality principle; i.e., it seeks to please (eb) the id's drive in realistic ways that will benefit in the long term rather than bring grief.

(253) At the same time, Freud concedes that as the ego "attempts to mediate between id and (e&eb) reality, it is often obliged to cloak the Ucs. [Unconscious] commands of the id with its own Pcs.

(254) [Preconscious] rationalizations, to conceal (e) the id's conflicts with reality, to profess ... to be taking notice of reality even when the id has remained rigid and unyielding."

(255) The reality principle that operates the ego is (=) a regulating mechanism that enables (eb) the individual to delay gratifying immediate needs and function effectively in the real world.

(256) An example would be to resist the urge to grab (e) other people's belongings and buy them instead.

(257) The ego is (=) the organized part of the personality structure that includes (e) defensive, perceptual, intellectual-cognitive, and executive functions.

(258) Conscious awareness resides in (eb) the ego, although not all of the operations of the ego are (=) conscious.

(259) Conscious awareness resides in (eb) the ego, although not all of the operations of the ego are (=) conscious.

(260) Originally, Freud used the word ego to mean a sense of self, but later revised it to mean(eb) a set of psychic functions such as judgment, tolerance, reality testing, control, planning, defense, synthesis of information, intellectual functioning, and memory.

(261) The ego separates (e&eb) out what is real.

(262) It helps us to organize (e&eb) our thoughts and make sense of them and the world around us.

(263) "The ego is that part of the id which has been modified by the direct influence (e&eb) of the external world. ...

(264) The ego represents (eb) what may be called reason and common sense, in contrast to the id, which contains (e) the passions ... in its relation to the id it is like a man on horseback, who has to hold in check the superior strength of the horse

(265) With this difference, that the rider tries to do so with his own strength, while the ego uses (e) borrowed forces."

(266) Still worse, "it serves (e) three severe masters ... the external world, the super-ego and the id."

(267) Its task is to find a balance between primitive drives and (e&eb) reality while satisfying the id and super-ego.

(268) Its main concern is with the individual's safety and allows (eb) some of the id's desires to be expressed, but only when consequences of these actions are marginal.

(269) "Thus the ego, driven by the id, confined by (e) the super-ego, repulsed by reality, struggles ... [in] bringing about harmony among the forces and influences (e&eb) working in and upon it," and readily "breaks out (eb) in anxiety—realistic anxiety regarding the external world, moral anxiety regarding the super-ego, and neurotic anxiety regarding the strength of the passions in the id."

(270) It has to do its best to suit all three, thus is constantly feeling hemmed by the danger of causing (eb) discontent on two other sides.

(271) It is said, however, that the ego seems to be (=) more loyal to the id, preferring to gloss over the finer details of reality to minimize(e) conflicts while pretending (eb) to have a regard for reality. But the super-ego is (=) constantly watching every one of the ego's moves and punishes (e) it with feelings of guilt, anxiety, and inferiority.

But the super-ego is (=) constantly watching every one of the ego's moves and punishes (e) it with feelings of guilt, anxiety, and inferiority.

(275) To overcome this ego employs (e) defense mechanisms.

(276) The defense mechanisms are (=) not done so directly or consciously.

(277) They lessen the tension by covering up (e) our impulses that are threatening.

(278) Ego defense mechanisms are often used by the ego when id behavior conflicts with (e&eb) reality and either society's morals, norms, and taboos or the individual's expectations as a result of the internalization of these morals, norms, and their taboos.

(279) Denial, displacement, intellectualisation, fantasy, compensation, projection, rationalization, reaction formation, regression, repression, and sublimation were the defense mechanisms Freud identified. However, his daughter Anna Freud clarified and identified the concepts of undoing, suppression, dissociation, idealization, identification, introjection, inversion, somatisation, splitting, and substitution.

(280) The ego is (=) not sharply separated from the id

(281) Its lower portion merges (e&eb) into it.

(282) But the repressed merges (e&eb) into the id as well, and is (=) merely a part of it.

(283) The repressed is(=) only cut off sharply from the ego by the resistances of repression

(284) It can communicate with the ego through (e&eb) the id." (Sigmund Freud, 1923)

(285) In a diagram of the Structural and Topographical Models of Mind, the ego is (=) depicted to be half in the consciousness, while a quarter is (=) in the preconscious and the other quarter lies in the unconscious.

(286) In modern English, ego has many meanings. It could mean (eb) one's self-esteem

(287) an inflated sense of (e) self-worth

(288) The conscious-thinking self or in philosophical terms, one's self. Ego development is(=) known as the development of multiple processes, cognitive function, defenses, and interpersonal skills or to early adolescence when ego processes are emerged.

Super-ego

(289) The superego (German: Über-Ich) reflects (e&eb) the internalization of cultural rules, mainly taught by parents applying their guidance and influence

(290) Freud developed his concept of the super-ego from an earlier combination of the ego ideal and the "special psychical agency which performs (eb) the task of seeing that narcissistic satisfaction from the ego ideal is (=) ensured ... what we call our 'conscience'."

(291) For him "the installation of the super-ego can be described (eb) as a successful instance of identification with the parental agency," while as development proceeds "the super-ego also takes on (e) the influence of those who have stepped into the place of parents — educators, teachers, people chosen as ideal models."

(292) The super-ego aims for perfection. It forms(eb) the organized part of the personality structure, mainly but does not form (eb) not entirely unconscious, that includes (e) the individual's ego ideals, spiritual goals, and the psychic agency (commonly called "conscience") that criticizes and prohibits (e) his or her drives, fantasies, feelings, and actions.

(293) "The Super-ego can be thought of as (=) a type of conscience that punishes (e) misbehavior with feelings of guilt. For example, for having extra-marital affairs."

(294) Taken in this sense, the super-ego is (=) the precedent for the conceptualization of the inner critic as it appears in contemporary therapies such as IFS and Voice Dialogue.

(295) The super-ego works in contradiction to (e&eb) the id.

(296) The super-ego strives to act(e&eb) in a socially appropriate manner

(297) Id just wants (e&eb) instant self-gratification.

(298) The super-ego controls (e&eb) our sense of right and wrong and guilt.

(299) It helps us fit into society by getting us to act (e&eb) in socially acceptable ways.

(300) The super-ego's demands often oppose (e) the ids, so the ego sometimes has (e) a hard time in reconciling the two.

(301) Freud's theory implies that the super-ego is (=) a symbolic internalisation of the father figure and cultural regulations.

(302) The super-ego tends to stand in opposition to the desires of the id because (e) of their conflicting objectives, and its aggressiveness towards the ego.

(303) The super-ego acts as (=) the conscience, maintaining our sense of morality and proscription from taboos.

(304) The super-ego and the ego are the product of (e) two key factors: the state of helplessness of the child and the Oedipus complex.

(305) Its formation takes place during the dissolution (e) of the Oedipus complex and is formed by (e) identification with and internalisation of the father figure after the little boy cannot successfully hold the mother as a love-object out of fear of castration.

(306) "The super-ego retains the character of the father, while the more powerful the Oedipus complex was and the more rapidly it succumbed to repression (under the influence of authority, religious teaching, schooling and reading),(eb) the stricter will be the domination of the super-ego over the ego later on—in the form of conscience or perhaps of an unconscious sense of guilt." —Freud, the Ego and the Id (1923)

(307) The concept of super-ego and the Oedipus complex is (=) subject to criticism for its perceived sexism.

(308) Women, who are considered to be already castrated, do not identify with the father, and therefore, for Freud, "their super-ego is (=) never so inexorable, so impersonal, as (=) independent of its emotional origins as we require it to be in men.

(309) They are often more influenced in their judgements by (e&eb) feelings of affection or hostility."

(310) However, Freud went on to modify his position to the effect "that the majority of men are also (=) far behind the masculine ideal and that all human individuals, as a result of (e) their bisexual disposition and of cross-inheritance, combine in (e&eb) themselves both masculine and feminine characteristics."

(311) In Sigmund Freud's work Civilization and Its Discontents (1930), he also discusses the concept of a "cultural super-ego". Freud suggested that the demands of the super-ego "coincide (=) with the precepts of the prevailing cultural super-ego.

(312) At this point the two processes which of the cultural development of the group and (e&eb) that of the cultural development of the individual are, as it were, always interlocked."

(313) Ethics are a central element in the demands of the cultural super-ego, but Freud (as analytic moralist) protested (e) against what he called "the unpsychological proceedings of the cultural super-ego ... the ethical demands of the cultural super-ego. It does not trouble itself enough about the facts of the mental constitution of human beings."

(314) Quantum entanglement or superposition is (=) a phenomenon in which the quantum states of two or more objects are linked together — even though the specific objects may be spatially separated.

(315) Since quantum entanglement implies (eb) faster than light-speed interactions, it creates (eb) an experience of non-locality, or what Albert Einstein called “spooky action at a distance” that defies classical and relativistic concepts of space and time.

(316) Rather, it ‘entangles’ two different atoms so that one atom inherits (e) the properties of another. ‘According to the quantum theory, everything vibrates,’ theoretical physicist Michio Kaku tells NPR’s Guy Raz.

(317) Kaku is a frequent guest on the Science and Discovery channels. ‘When two electrons are placed close together, they vibrate in (eb) unison.

(318) When you separate them, that’s when all the fireworks start.’ This is where quantum entanglement — sometimes described as (=) ‘teleportation’ — begins. ‘

(319) An invisible umbilical cord emerges connecting (e&eb) these two electrons.

(320) And you can separate them by as much as a galaxy if you want. Then, if you vibrate one of them, somehow on the other end of the galaxy the other electron knows (e) that its partner is being jiggled.'

(321) This process happens even faster than the speed of light, physicists say." ("Scientists Take Quantum Steps Toward model Teleportation," NPR, Aug 1, 2010)

(322) "Subatomic particles do it. Now the observation that groups of brain cells seem to have their own version of quantum entanglement, or 'spooky action at a distance', could help (e) explain how our minds combine experiences from many different senses into one memory.

(323) Previous experiments have shown that the electrical activity of neurons in separate parts of the brain can oscillate (e&eb) simultaneously at the same frequency — a process known as phase locking.

(324) The frequency seems to be (=) a signature that marks out neurons working on the same task, allowing them to identify each other." ("Brain 'entanglement' could explain memories," David Robson, New Scientist, Jan 12, 2010)

(325) Psychic powers and extra-sensory perception (ESP) are (=) among the most significant unsolved phenomena at present, since belief in them is so common. ESP is (=) frequently called the "sixth sense."

(326) It is sensory information that a person supposedly receives beyond (e) the ordinary five senses of sight, hearing, smell, taste, and touch.

(327) Sir Richard Burton used the term ESP in 1870. The first controlled study of ESP was organized in 1882, when the Society for Psychical Research was founded in London.

(328) In the 1920s a Munich specialist in medical and surgical eye problems, Dr. Rudolph Tischner, referred to ESP as (=) the externalization of sensibility. In the 1930s the American parapsychologist J. B. Rhine at Duke University, Durham, N.C., popularized the term to include psychic phenomena related to sensory functions. Rhine was among the first parapsychologists to test ESP proficiency in the laboratory.

(329) The term "psi," referring(=) to extrasensory perception and psychokinesis, was coined by biologist Bertold P. Wiesner, and first used by psychologist Robert Thouless in a 1942 article in the British Journal of Psychology. .

(330) "According to periodic surveys by Gallup and other pollsters, fully 90 percent of Americans say they have experienced such things or believe they exist." ("Why We Believe," Sharon Begley, NEWSWEEK, Nov 3, 2008) .Swiss psychologist Carl Gustav Jung first described his idea of "synchronicity" in the 1920s. Sigmund Freud and Carl Jung first met in 1907 and had a significant influence (e&eb) on each other's theories.

(331) Synchronicity is the relationship of two or more seemingly causally unconnected events occurring (eb) together in a meaningful way.

(332) To be valid as synchronicity, the events must be (=) unlikely to happen together by chance.

(333) Jung introduced his concept as early as the 1920s but only gave a full description of it in 1951 in an Eranos lecture. In 1952, he published a paper, "Synchronicity — An Acausal Connecting Principle," in a book with a related study by the physicist and Nobel laureate Wolfgang Pauli. After discussions with both Einstein and Pauli, Jung believed that there were (=) similarities between synchronicity and quantum mechanics.

(334) Synchronicity was (=) explanatory of a dynamic that underlies the human experience.

(335) Jung coined the word to describe (eb) what he called "temporally coincident occurrences of acausal events."

(336) It was a theory that Jung felt gave convincing evidence (eb) for his concepts of archetypes and the collective unconscious from Freud's psychoanalysis.

Ultrasonic Balance Organs

(337) Essential to a fully embodied sense of self is (=) the vestibular system, a paired set of tiny sensory organs tucked deep into the temporal bone on either side of the head, right near the cochlea of the inner ear.

(338) The vestibular system isn't a high-profile, elitist sense like the famed five of vision, hearing, touch, taste and smell. It's (=) more of a Joe Sixth-Sense, laboring in anonymity and frequently misunderstood." ("The unsung system that makes walking possible," Natalie Angier, International Herald Tribune, Oct 29, 2008)

(339) "Three of the organs are designed to detect (e&eb) twisting movements of the head, by sensing the discrepancy between the angular momentum of the membranes, which are attached (e&eb) to the bone, and that of the free-floating fluid, which lags slightly behind.

(340) The other two organs have (e) tiny stones of calcium carbonate, which rise and fall like flakes in a snow globe and so detect the effects of gravity and of linear head motions, if you're walking forward, for example, or up stairs."

(341) Carl Jung believed that many experiences that are(=) "coincidences due to chance" in terms of causality suggested (eb) the manifestation of parallel events or circumstances in terms of meaning.

(342) His synchronicity concept reflected (e&eb) a mysterious effect very similar to quantum entanglement. Sigmund Freud observed this line of reasoning in his essay "Dreams and Telepathy" (1922) pertaining to synchronicity.

(343) Jung was fascinated by the idea that life was (=) not a series of random events but rather (=) an expression of a deeper order, and that the realization of this was a spiritual awakening.

(344) Yet, most scientists in those days barely mentioned the vestibular system and did not dream that it could contain (e) "little organic gyroscopes and linear accelerometers."

(345) The vestibular system is not only crucial for perceptual stability, but it is also required (e) to produce neural representations of the environment in order to accurately guide our behavior.

(346) Loss of function can produce (eb) an imbalance that manifests as stress symptoms or a dramatic, sudden onset of vertigo.

(347) By harmonizing the brain's hemispheres, people can stimulate (eb) the vestibular system to ease types of stress and create a healthy, balanced attentive state:

(348) Despite its humble status, the vestibular system has lately gained admirers among neuroscientists, who are amazed by its significance for (e) perceptual equilibrium and general health. Vestibule dysfunction increases the risk of falling by a factor of 12, according to a recent medical study:

Advantages of the structural model

Freud's earlier, topographical model of the mind had divided the mind into the three elements of conscious, preconscious, and unconscious. The conscious contains events that we are aware of, preconscious is events that are in the process of becoming conscious, and unconscious include events that we are not aware of At its heart was "the dialectic of unconscious traumatic memory versus consciousness ... which soon became a conflict between System Ucs versus System Cs."[36] With what Freud called the "disagreeable discovery that on the one hand (super-)ego and conscious and on the other hand repressed and unconscious are far from coinciding," Freud took the step in the structural model to "no longer use the term 'unconscious' in the systematic sense," and to rename "the mental region that is foreign to the ego ... [and] in future call it the 'id'." The partition of the psyche defined in the structural model is thus one that cuts across the topographical model's partition of "conscious vs. unconscious".

"The new terminology which he introduced has a highly clarifying effect and so made further clinical advances possible."[39] Its value lies in the increased degree of precision and diversification made possible: Although the id is unconscious by definition, the ego and the super-ego are both partly conscious and partly unconscious. What is more, with this new model Freud achieved a more systematic classification of mental disorder than had been available previously:

"Transference neuroses correspond to a conflict between the ego and the id; narcissistic neuroses, to a conflict between the ego and the superego; and psychoses, to one between the ego and the external world."

—Freud, Neurosis and Psychosis (1923)

It is important to realise however, that "the three newly presented entities, the id, the ego and the superego, all had lengthy past histories (two of them under other names)"[40]—the id as the systematic unconscious, the super-ego as conscience/ego ideal. Equally, Freud never abandoned the topographical division of conscious, preconscious, and unconscious, though as he noted ruefully "the three qualities of consciousness and the three provinces of the mental apparatus do not fall together into three peaceful couples ... we had no right to expect any such smooth arrangement."[41]

The iceberg metaphor is a commonly used visual when attempting to relate the ego, id and superego with the conscious and unconscious mind. In the iceberg metaphor the entire id and part of both the superego and the ego would be submerged in the underwater portion representing the unconscious mind. The remaining portions of the ego and superego would be displayed above water in the conscious mind area.

Translation

The terms "id", "ego", and "super-ego" are not Freud's own. They are latinisations by his translator James Strachey. Freud himself wrote of "das Es," "das Ich," and "das Über-Ich"—respectively, "the It", "the I", and the "Over-I" (or "I above"); thus to the German reader, Freud's original terms are more or less self-explanatory. Freud borrowed the term "das Es" from Georg Groddeck, a German physician to whose unconventional ideas Freud was much attracted (Groddeck's translators render the term in English as "the It"). The word ego is taken directly from Latin, where it is the nominative of the first person singular personal pronoun and is translated as "I myself" to express emphasis.

Figures like Bruno Bettelheim have criticized the way "the English translations impeded students' efforts to gain a true understanding of Freud." by substituting the formalised language of the elaborated code for the quotidian immediacy of Freud's own language. (Wikipedia)

You said that Brahman-AntiBrahman like Terrestial one uses you as a pawn in the scheme of things?

Yes!

Do you think all those murder, mayhem, plunder, pillage, nemesis, apocalypse would not have taken place unless some one is intimidated, coerced or paid with lot of money?

Yes!

Then why choose me?

No! More often than not it does not come despite concerted efforts and sustained protracted endeavours!

Yes!

So he chooses people who lead you to such situations!

Donot you think they are being slaves of mind and fabricating and concocting theories without soul at all!

That is true!

They still are not sure of origin, they talk everything after!

Yes!

They donot know why humans dream but analyse dreams!

They donot know how cancer is produced but talk of sites and redressal measures!

That is known when I=Cosmic general ledger (cosmic consciousness; see earlier models)

Is there any speculative or self consistency in the Law of karma!

I am telling you that cosmic general ledger has to be conservation and Prrabhdha is the one that stands out! That is opening balance!

You have to enter the world with the certain configuration of stars!

OK! I entered the world! Then?

You pay back your debts and there might be astronomical interest. It might be AP, GP, or fibbanoci sometimes!

Why so?

Because some people charge usurious interest rates!

Lower level gods or devils?

Yes!

From them you have sought favours!

They could be in this world

They could in the subterranean realm of and ceratoid dualism of space and time and in this universe!

Then it must affect the opening balance of that gentleman?

Certainly!

Is there any relation between structural functionalism and quantum teleportation of energy?

I feel like teleporting or resorting to transmutation from this evil world!

Like asking what is the relationship between Rama and Sita after hearing Ramayana!

A message from Chris Carter Chris Carter, author of Science and Psychic Phenomena and other books has sent me a detailed response to J.E. Kennedy's review and to some of the comments that have appeared on this blog. He's given me permission to publish it, so here it is in its entirety. (Everything that follows is from Chris.) Some paragraphs are deleted due to spatial constraints.

Ersby's comments

(1) "Kennedy's argument is that meta-analyses offer enough subjective leeway to adjust (e&eb) results until the required figure is achieved.
(2) Meta-analysis is essentially combining many smaller studies into one larger study in order to exploit (e) the greater statistical power of larger sample sizes to detect effects with statistical significance.
(3) As such, it is only useful when all of the studies are of the same nature. This is indeed standard practice, and common sense.

Entangled minds

(4) If I understand this news item correctly (and it's very possible that I don't), it may provide additional ammunition for the view that consciousness directly affects (e&eb) physical reality at the quantum level.
(5) By varying the strength of the coupling between the nucleus and (e&eb) the electron, the scientists could carefully tune the measurement strength.
(6) A weaker measurement reveals (eb) less information, but also has less back-action.
(7) An analysis of the nuclear spin after such a weak measurement showed (eb) that the nuclear spin remained in a (slightly altered) superposition of two states.
(8) In this way, the scientists verified that the change of the state (induced by the back-action) precisely matched (=) the amount of information that was gained by the measurement.
(9) The scientists realised that it is possible to steer the nuclear spin by applying sequential measurements with varying measurement strength. Since the outcome of a measurement is not known in advance, the researchers implemented a feedback loop in the experiment. They chose the strength of the second measurement depending on the outcome of the first measurement. In this way the scientists could steer (e&eb) the nucleus towards a desired superposition state by only looking at it. This result provides new insight in the role of measurements in quantum mechanics.
(10) It's not clear to me, however, if this experiment really establishes a direct role for consciousness, or if, as one commenter at the linked article put it, the real takeaway is "that a quantum object can be steered by (e&eb) interaction with another quantum object without (e) decoherence or any non-quantum (classical) interactions."

February 18, 2014 in Consciousness, Science | Permalink COMMENTS "It's not clear to me..." It's not just you, Michael.

Particle-wave duality and the various expressions of the double slit experiment, the Heisenberg principle, quantum entanglement and its interactions at a distance, mathematics embedded in the cosmos, the illusory nature of time, the hard problem of consciousness...this list could go on and on. Sometimes, as linear thinking humans, I think we're all missing something that we may never be able to fully grasp intellectually.

But that shouldn't stop us from trying. Posted by: Rabbitdawg | February 18, 2014 at 05:15 PM

I didn't "read" the article per se, but from what I've come to know, "measuring" subatomic particles involves hitting them with other subatomic particles (electrons or photons). This is just my speculation, but "steering the nuclear spin by applying sequential measurements" might be like steering a boat by throwing tennis balls at it from shore. There's definitely the intention of the experimentor to steer the nucleus, but I don't think it would necessarily involve PK like altering random sequences. With measuring single particles I'm not sure how one could separate the conscious intention and the physical act of hitting it with another particle to make the actual measurement.

That means there would be evolution of consciousness with the expansion?

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\left|G^{(1)} - G^{(2)}\right| e^{-(\widehat{M}_{13})^{(1)} t} \leq \qquad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}} \left((a_{13})^{(1)} + (a'_{13})^{(1)} + (\widehat{A}_{13})^{(1)} + (\widehat{P}_{13})^{(1)} (\widehat{k}_{13})^{(1)}\right) d\left(\left(G^{(1)}, T^{(1)}; G^{(2)}, T^{(2)}\right)\right)$$

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)} t}$ *and* $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)} t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13,14,15$ depend only on T_{14} and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)} (T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(1)} t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also G_{14} *and* G_{15} . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)} \left((\widehat{M}_{13})^{(1)}\right)_1 / (a'_{14})^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)} \left((\widehat{M}_{13})^{(1)}\right)_2 / (a'_{15})^{(1)}$$

If G_{14} *or* G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} *is* bounded, from below, the same property holds for G_{14} *and* G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}(G(t),t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

For $0 < \boxed{(v_0)^{(1)} = \frac{G^0_{13}}{G^0_{14}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$v^{(1)}(t) \le \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}}$$

$$\frac{(\bar{\nu}_1)^{(8)} + (\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}}{1 + (\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\bar{\nu}_1)^{(8)}$$

If $0 < (\nu_1)^{(8)} \leq (\bar{\nu}_1)^{(8)} \leq \boxed{(\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0}}$, we obtain 424

$$(\nu_1)^{(8)} \leq \nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)} + (\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}}{1 + (\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\nu_0)^{(8)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(8)}(t)$:-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(8)}(t)$:-

$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}$, $\boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{40})^{(8)} = (a''_{41})^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)} G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b''_{40})^{(8)} = (b''_{41})^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then
$(u_1)^{(8)} = (\bar{u}_1)^{(8)}$if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)} T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

Proof : From 99,20,44,22,23,44 we obtain

$$\frac{d\nu^{(9)}}{dt} = (a_{44})^{(9)} - \left((a'_{44})^{(9)} - (a'_{45})^{(9)} + (a''_{44})^{(9)}(T_{45}, t)\right) - (a''_{45})^{(9)}(T_{45}, t)\nu^{(9)} - (a_{45})^{(9)}\nu^{(9)}$$

Definition of $\nu^{(9)}$:- $\boxed{\nu^{(9)} = \frac{G_{44}}{G_{45}}}$

It follows

$$-\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_2)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right) \leq \frac{d\nu^{(9)}}{dt} \leq -\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_1)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(9)}, (\nu_0)^{(9)}$:-

For $0 < \boxed{(\nu_0)^{(9)} = \frac{G^0_{44}}{G^0_{45}}} < (\nu_1)^{(9)} < (\bar{\nu}_1)^{(9)}$

$$\nu^{(9)}(t) \geq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}} \quad , \quad \boxed{(C)^{(9)} = \frac{(\nu_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\nu_2)^{(9)}}}$$

it follows $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\nu_9)^{(9)}$

In the same manner , we get

$$\nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(9)} = \frac{(\bar{\nu}_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\bar{\nu}_2)^{(9)}}}$$

From which we deduce $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\bar{\nu}_1)^{(9)}$

If $0 < (\nu_1)^{(9)} < (\nu_0)^{(9)} = \frac{G^0_{44}}{G^0_{45}} < (\bar{\nu}_1)^{(9)}$ we find like in the previous case,

$$(\nu_1)^{(9)} \le \frac{(\nu_1)^{(9)}+(C)^{(9)}(\nu_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)}-(\nu_2)^{(9)}\right)t\right]}}{1+(C)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)}-(\nu_2)^{(9)}\right)t\right]}} \le \nu^{(9)}(t) \le$$

$$\frac{(\bar{\nu}_1)^{(9)}+(\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}}{1+(\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}} \le (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \le (\bar{\nu}_1)^{(9)} \le \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}}$, we obtain

$$(\nu_1)^{(9)} \le \nu^{(9)}(t) \le \frac{(\bar{\nu}_1)^{(9)}+(\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}}{1+(\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}} \le (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(9)}(t)$:-

$$(m_2)^{(9)} \le \nu^{(9)}(t) \le (m_1)^{(9)}, \quad \boxed{\nu^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(9)}(t)$:-

$$(\mu_2)^{(9)} \le u^{(9)}(t) \le (\mu_1)^{(9)}, \quad \boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

Particular case :

If $(a''_{44})^{(9)} = (a''_{45})^{(9)}, then\ (\sigma_1)^{(9)} = (\sigma_2)^{(9)}$ and in this case $(\nu_1)^{(9)} = (\bar{\nu}_1)^{(9)}$ if in addition $(\nu_0)^{(9)} = (\nu_1)^{(9)}$ then $\nu^{(9)}(t) = (\nu_0)^{(9)}$ and as a consequence $G_{44}(t) = (\nu_0)^{(9)}G_{45}(t)$ **this also defines** $(\nu_0)^{(9)}$ **for the special case** .

Analogously if $(b''_{44})^{(9)} = (b''_{45})^{(9)}, then\ (\tau_1)^{(9)} = (\tau_2)^{(9)}$ and then $(u_1)^{(9)} = (\bar{u}_1)^{(9)}$if in addition $(u_0)^{(9)} = (u_1)^{(9)}$ then $T_{44}(t) = (u_0)^{(9)}T_{45}(t)$ This is an important consequence of the relation between $(\nu_1)^{(9)}$ and $(\bar{\nu}_1)^{(9)}$, **and definition of** $(u_0)^{(9)}$.

ASYMPTOTIC STABILITY ANALYSIS (586 A)

Theorem 9: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(9)}$ *and* $(b_i'')^{(9)}$ Belong to $C^{(9)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of $\mathbb{G}_i, \mathbb{T}_i$:-

$$G_i = G_i^* + \mathbb{G}_i \qquad , T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial (a_{45}'')^{(9)}}{\partial T_{45}}(T_{45}^*) = (q_{45})^{(9)} \quad , \frac{\partial (b_i'')^{(9)}}{\partial G_j}((G_{47})^*) = s_{ij}$$

Then taking into account equations 89 to 99 and neglecting the terms of power 2, we obtain from 99 to 44

$$\frac{d\mathbb{G}_{44}}{dt} = -\left((a_{44}')^{(9)} + (p_{44})^{(9)}\right)\mathbb{G}_{44} + (a_{44})^{(9)}\mathbb{G}_{45} - (q_{44})^{(9)}G_{44}^*\mathbb{T}_{45} \quad (586\ B)$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

Space Stretch Or Space Expansion: Abundans Cautela Non Nocet: Abundant Caution Does No Harm

INTRODUCTION—VARIABLES USED

Does space stretch or does new space get created, and what does that mean for the conservation of energy? Ethan Siegel Ethan Siegel in Starts with a Bang! (1) But you might worry about what's actually going on with space, itself, in (eb) an expanding Universe.
(2) As you might have intuited, space is (=) not really getting thinner, stretched or more tenuous in any real sense of the word.
(3) A stretched balloon will eventually burst, bread has (e) a maximum size to which it can leaven, and space has (e) no such limit.
(4) In addition, space is (=) not like the space of today has (e) different intrinsic properties from the space of 10 billion years ago, nor will it have (e) different properties 10 billion years from now.
(5) In addition, space is (=) not like the space of today has(e) different intrinsic properties from the space of 10 billion years ago, nor will it have (e) different properties 10 billion years from now
(6) In addition, space is not like the space of today has different intrinsic properties from the space of 10 billion years ago, nor will it have (e) different properties 10 billion years from now
(7) A superior picture is one where, as the Universe expands, more and more space simply gets created (eb) in between these tightly gravitationally bound (e&eb) structures. Image credit: Large Synoptic Survey Telescope, NSF, DOE, and AURA.
(8) We could have lived in a Universe that will someday recollapse (e) (orange curve) under its own gravity, expanded away (eb) into infinity (blue curve) because (e) gravitation was insufficient to recollapse it, or (green curve) skated right on the border between the two, where the expansion rate (=) drops to zero, asymptotically, but if there were even one more proton in the Universe, it would have recollapsed(e) (image deleted due to restrictions on space. please see Ethan's paper. I will write as if the diagram is present)
(9) But none of those is (=) our Universe; we live on the red curve, where there's (=) an intrinsic, positive energy to space itself.

The operator $\mathcal{A}^{(9)}$ maps the space of functions satisfying 34,35,36 into itself .Indeed it is obvious that

$$G_{44}(t) \le G_{44}^0 + \int_0^t \left[(a_{44})^{(9)} \left(G_{45}^0 + (\hat{P}_{44})^{(9)} e^{(\tilde{M}_{44})^{(9)} s_{(44)}}\right)\right] ds_{(44)} =$$
$$\left(1 + (a_{44})^{(9)} t\right) G_{45}^0 + \frac{(a_{44})^{(9)} (\hat{P}_{44})^{(9)}}{(\tilde{M}_{44})^{(9)}} \left(e^{(\tilde{M}_{44})^{(9)} t} - 1\right)$$

From which it follows that

$$(G_{44}(t) - G_{44}^0) e^{-(\tilde{M}_{44})^{(9)} t} \le \frac{(a_{44})^{(9)}}{(\tilde{M}_{44})^{(9)}} \left[\left((\hat{P}_{44})^{(9)} + G_{45}^0\right) e^{\left(-\frac{(\hat{P}_{44})^{(9)} + G_{45}^0}{G_{45}^0}\right)} + (\hat{P}_{44})^{(9)}\right]$$

(G_i^0) is as defined in the statement of theorem 9

Analogous inequalities hold also for $G_{45}, G_{46}, T_{44}, T_{45}, T_{46}$

It is now sufficient to take $\frac{(a_i)^{(1)}}{(\tilde{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\tilde{M}_{13})^{(1)}} < 1$ and to choose 182

$(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ large to have

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,\mathrm{t}]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \quad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\hat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on

$G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 19 to 24 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}\,(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

Proof : From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(1)}(t)$:-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

it follows $(v_0)^{(4)} \leq v^{(4)}(t) \leq (v_1)^{(4)}$

In the same manner , we get 405

$$v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}\right)t\right]}}{4 + (\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(4)} = \frac{(\bar{v}_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (\bar{v}_2)^{(4)}}}$$

From which we deduce $(v_0)^{(4)} \leq v^{(4)}(t) \leq (\bar{v}_1)^{(4)}$

If $0 < (v_1)^{(4)} < (v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{v}_1)^{(4)}$ we find like in the previous case, 406

$$(v_1)^{(4)} \leq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((v_1)^{(4)} - (v_2)^{(4)}\right)t\right]}}{1 + (C)^{(4)}e^{\left[-(a_{25})^{(4)}\left((v_1)^{(4)} - (v_2)^{(4)}\right)t\right]}} \leq v^{(4)}(t) \leq$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(8)}(t)$:-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(8)}(t)$:-

$$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}, \quad \boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a_{40}'')^{(8)} = (a_{41}'')^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)}G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b_{40}'')^{(8)} = (b_{41}'')^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then
$(u_1)^{(8)} = (\bar{u}_1)^{(8)}$ if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)}T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

424 A

Proof : From 99,20,44,22,23,44 we obtain

$$\frac{d\nu^{(9)}}{dt} = (a_{44})^{(9)} - \left((a_{44}')^{(9)} - (a_{45}')^{(9)} + (a_{44}'')^{(9)}(T_{45}, t)\right) - (a_{45}'')^{(9)}(T_{45}, t)\nu^{(9)} - (a_{45})^{(9)}\nu^{(9)}$$

Definition of $\nu^{(9)}$:- $\quad \boxed{\nu^{(9)} = \frac{G_{44}}{G_{45}}}$

It follows

$$-\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_2)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right) \leq \frac{d\nu^{(9)}}{dt} \leq -\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_1)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(9)}, (\nu_0)^{(9)}$:-

For $0 < \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}} < (\nu_1)^{(9)} < (\bar{\nu}_1)^{(9)}$

$$\nu^{(9)}(t) \geq \frac{(\nu_1)^{(9)}+(C)^{(9)}(\nu_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)}-(\nu_0)^{(9)}\right)t\right]}}{1+(C)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)}-(\nu_0)^{(9)}\right)t\right]}} \quad , \quad \boxed{(C)^{(9)} = \frac{(\nu_1)^{(9)}-(\nu_0)^{(9)}}{(\nu_0)^{(9)}-(\nu_2)^{(9)}}}$$

it follows $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\nu_9)^{(9)}$

In the same manner , we get

$$\nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)}+(\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}}{1+(\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(9)} = \frac{(\bar{\nu}_1)^{(9)}-(\nu_0)^{(9)}}{(\nu_0)^{(9)}-(\bar{\nu}_2)^{(9)}}}$$

From which we deduce $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\bar{\nu}_1)^{(9)}$

If $0 < (\nu_1)^{(9)} < (\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0} < (\bar{\nu}_1)^{(9)}$ we find like in the previous case,

$$(\nu_1)^{(9)} \leq \frac{(\nu_1)^{(9)}+(C)^{(9)}(\nu_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)}-(\nu_2)^{(9)}\right)t\right]}}{1+(C)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)}-(\nu_2)^{(9)}\right)t\right]}} \leq \nu^{(9)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(9)}+(\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}}{1+(\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \leq (\bar{\nu}_1)^{(9)} \leq \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}}$, we obtain

$$(\nu_1)^{(9)} \leq \nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)}+(\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}}{1+(\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(9)}(t)$:-

$$(m_2)^{(9)} \leq \nu^{(9)}(t) \leq (m_1)^{(9)}, \quad \boxed{\nu^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(9)}(t)$:-

$$(\mu_2)^{(9)} \leq u^{(9)}(t) \leq (\mu_1)^{(9)}, \quad \boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

Particular case :

If $(a''_{44})^{(9)} = (a''_{45})^{(9)}, then\ (\sigma_1)^{(9)} = (\sigma_2)^{(9)}$ and in this case $(\nu_1)^{(9)} = (\bar{\nu}_1)^{(9)}$ if in addition $(\nu_0)^{(9)} = (\nu_1)^{(9)}$ then $\nu^{(9)}(t) = (\nu_0)^{(9)}$ and as a consequence $G_{44}(t) = (\nu_0)^{(9)}G_{45}(t)$ **this also defines** $(\nu_0)^{(9)}$ **for**

the special case .

Analogously if $(b''_{44})^{(9)} = (b''_{45})^{(9)}, then\ (\tau_1)^{(9)} = (\tau_2)^{(9)}$ and then
$(u_1)^{(9)} = (\bar{u}_1)^{(9)}$if in addition $(u_0)^{(9)} = (u_1)^{(9)}$ then $T_{44}(t) = (u_0)^{(9)}T_{45}(t)$ This is an important consequence of the relation between $(v_1)^{(9)}$ and $(\bar{v}_1)^{(9)}$, **and definition of** $(u_0)^{(9)}$.

Theorem 9: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(9)}\ and\ (b_i'')^{(9)}$ Belong to $C^{(9)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of $\mathbb{G}_i, \mathbb{T}_i$:-

$$G_i = G_i^* + \mathbb{G}_i \qquad , T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial(a''_{45})^{(9)}}{\partial T_{45}}(T^*_{45}) = (q_{45})^{(9)} \ , \ \frac{\partial(b_i'')^{(9)}}{\partial G_j}(\ (G_{47})^*\ ) = s_{ij}$$

Then taking into account equations 89 to 99 and neglecting the terms of power 2, we obtain from 99 to 44

$$\frac{d\mathbb{G}_{44}}{dt} = -\left((a'_{44})^{(9)} + (p_{44})^{(9)}\right)\mathbb{G}_{44} + (a_{44})^{(9)}\mathbb{G}_{45} - (q_{44})^{(9)}G^*_{44}\mathbb{T}_{45} \quad 586\ B$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

Energy Intrinsic To Empty Space: Quemadmodum Desiderat Cervus Ad Fontes Aquarum Ita Desiderat Anima Mea Ad Te Deus:(In The Same Way That The Stag Is Drawn Unto The Sources Of Water, So Is My Soul Drawn Unto You, God)

INTRODUCTION—VARIABLES USED

Image credit: BRI composite-image of the FORS Deep Field, ESO, VLT. Is energy conserved in a Universe with dark energy? Does space stretch or does new space get created, and what does that mean for the conservation of energy? Ethan Siegel Ethan Siegel in Starts with a Bang! Some sentences and images are deleted due to spatial constraints http://www.youtube.com/watch?v=08LBltePDZw

(1) That's what dark energy actually is: the energy intrinsic to (e) empty space.
(2) And at this point in time, it's responsible (e) for more than two-thirds of the total energy in the Universe, a ratio that will only continue to increase (eb) as the Universe continues to expand, and more space continues to be spontaneously created. Image credit: Wikimedia Commons user Szczureq.
(3) "Wait a minute," I hear you objecting, "If you're just spontaneously creating more space out of nothing, and space has an intrinsic energy, aren't you violating (e) the conservation of energy?"

It's a good objection. It's a reasonable objection. And it's not one that I'm going to weasel my way out of on the technicality that in General Relativity, "energy" is not a technically well-defined quantity. Because even though that's technically true, we still have a good intuition about energy and its different types. Image credit: Mark Garlick / Science Photo Library, retrieved from BBC Universe.

(4) We know that there's gravitational potential energy (eb) which tells us how tightly things are bound.
(5) We know that there's kinetic energy, which is (=) the energy of motion.
(6) And we know about nuclear, chemical, electrical, and a whole lot of other forms of energy.

$$E_r = \sqrt{(m_0c^2)^2 + (pc)^2}$$

(7) $^{235}_{92}U + ^{1}_{0}n \longrightarrow ^{145}_{57}La + ^{88}_{35}Br + 3^{1}_{0}n$

(8) Well, there's one more that I want you to keep in mind, and it's one you don't think about very often: work. Work is (=) the amount of energy done when you apply a force to a moving object over a distance, in the same direction that the object's distance changes. Images credit: Eric Harpell, retrieved from lpc1.clpccd.cc.ca.us, modified by me.

(9) What this means—in a gravitational field—is that if you apply a force upwards to an upwards-moving book, you do (eb) positive work. (I.e., you add energy to the system.)

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on

$G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 19 to 24 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t), t) = (b_{15}')^{(1)}$

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^{0}}{G_{14}^{0}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)}+(C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(8)}(t)$:-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(8)}(t)$:-

$$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}, \quad \boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a_{40}'')^{(8)} = (a_{41}'')^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)}G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b_{40}'')^{(8)} = (b_{41}'')^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then
$(u_1)^{(8)} = (\bar{u}_1)^{(8)}$ if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)}T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

424 A

Proof : From 99,20,44,22,23,44 we obtain

$$\frac{d\nu^{(9)}}{dt} = (a_{44})^{(9)} - \left((a_{44}')^{(9)} - (a_{45}')^{(9)} + (a_{44}'')^{(9)}(T_{45}, t)\right) - (a_{45}'')^{(9)}(T_{45}, t)\nu^{(9)} - (a_{45})^{(9)}\nu^{(9)}$$

Definition of $\nu^{(9)}$:- $\quad \boxed{\nu^{(9)} = \frac{G_{44}}{G_{45}}}$

It follows

$$-\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_2)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right) \leq \frac{d\nu^{(9)}}{dt} \leq -\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_1)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(9)}, (\nu_0)^{(9)}$:-

For $0 < \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}} < (\nu_1)^{(9)} < (\bar{\nu}_1)^{(9)}$

$$\nu^{(9)}(t) \geq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}} \quad , \quad \boxed{(C)^{(9)} = \frac{(\nu_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\nu_2)^{(9)}}}$$

it follows $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\nu_9)^{(9)}$

In the same manner , we get

$$\nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(9)} = \frac{(\bar{\nu}_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\bar{\nu}_2)^{(9)}}}$$

From which we deduce $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\bar{\nu}_1)^{(9)}$

If $0 < (\nu_1)^{(9)} < (\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0} < (\bar{\nu}_1)^{(9)}$ we find like in the previous case,

$$(\nu_1)^{(9)} \leq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}} \leq \nu^{(9)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \leq (\bar{\nu}_1)^{(9)} \leq \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}}$, we obtain

$$(\nu_1)^{(9)} \leq \nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(9)}(t)$:-

$$(m_2)^{(9)} \leq \nu^{(9)}(t) \leq (m_1)^{(9)}, \quad \boxed{\nu^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(9)}(t)$:-

$$(\mu_2)^{(9)} \leq u^{(9)}(t) \leq (\mu_1)^{(9)}, \quad \boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

Particular case :

If $(a''_{44})^{(9)} = (a''_{45})^{(9)}, then\ (\sigma_1)^{(9)} = (\sigma_2)^{(9)}$ and in this case $(\nu_1)^{(9)} = (\bar{\nu}_1)^{(9)}$ if in addition $(\nu_0)^{(9)} = (\nu_1)^{(9)}$ then $\nu^{(9)}(t) = (\nu_0)^{(9)}$ and as a consequence $G_{44}(t) = (\nu_0)^{(9)} G_{45}(t)$ **this also defines** $(\nu_0)^{(9)}$ **for**

the special case .

Analogously if $(b''_{44})^{(9)} = (b''_{45})^{(9)}, then\ (\tau_1)^{(9)} = (\tau_2)^{(9)}$ and then
$(u_1)^{(9)} = (\bar{u}_1)^{(9)}$if in addition $(u_0)^{(9)} = (u_1)^{(9)}$ then $T_{44}(t) = (u_0)^{(9)}T_{45}(t)$ This is an important consequence of the relation between $(v_1)^{(9)}$ and $(\bar{v}_1)^{(9)}$, **and definition of** $(u_0)^{(9)}$.

Theorem 9: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(9)}\ and\ (b_i'')^{(9)}$ Belong to $C^{(9)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of $\mathbb{G}_i, \mathbb{T}_i$:-

$$G_i = G_i^* + \mathbb{G}_i \qquad , T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial(a''_{45})^{(9)}}{\partial T_{45}}(T^*_{45}) = (q_{45})^{(9)} \ , \ \frac{\partial(b''_i)^{(9)}}{\partial G_j}(\ (G_{47})^*\ ) = s_{ij}$$

Then taking into account equations 89 to 99 and neglecting the terms of power 2, we obtain from 99 to 44

$$\frac{d\mathbb{G}_{44}}{dt} = -\left((a'_{44})^{(9)} + (p_{44})^{(9)}\right)\mathbb{G}_{44} + (a_{44})^{(9)}\mathbb{G}_{45} - (q_{44})^{(9)}G^*_{44}\mathbb{T}_{45} \quad 586\ B$$

$$\frac{d\mathbb{G}_{45}}{dt} = -\left((a'_{45})^{(9)} + (p_{45})^{(9)}\right)\mathbb{G}_{45} + (a_{45})^{(9)}\mathbb{G}_{44} - (q_{45})^{(9)}G^*_{45}\mathbb{T}_{45} \quad 586\ C$$

$$\frac{d\mathbb{T}_{44}}{dt} = -\left((b'_{44})^{(9)} - (r_{44})^{(9)}\right)\mathbb{T}_{44} + (b_{44})^{(9)}\mathbb{T}_{45} + \sum_{j=44}^{46}\left(s_{(44)(j)}T^*_{44}\mathbb{G}_j\right) \quad 586\ E$$

$$\frac{d\mathbb{T}_{45}}{dt} = -\left((b'_{45})^{(9)} - (r_{45})^{(9)}\right)\mathbb{T}_{45} + (b_{45})^{(9)}\mathbb{T}_{44} + \sum_{j=44}^{46}\left(s_{(45)(j)}T^*_{45}\mathbb{G}_j\right) \quad 586\ F$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

INTRODUCTION—VARIABLES USED

Image credit: BRI composite-image of the FORS Deep Field, ESO, VLT. Is energy conserved in a Universe with dark energy? Does space stretch or does new space get created, and what does that mean for the conservation of energy? Ethan Siegel Ethan Siegel in Starts with a Bang! Some sentences and images are deleted due to spatial constraints http://www.youtube.com/watch?v=08LBltePDZw

(1) But if you apply a force upwards to a downwards moving object, you do (=) negative work. (I.e., you remove energy from the system.)
(2) In general, when you push in the same direction the book is moving, you do positive work, adding (eb) energy to the system, and when you push in the opposite direction, you do (eb) negative work.
(3) Now, let's think about the Universe. You've got this sphere-like object expanding, and there you are, this constant energy density (i.e., dark energy), and you fill the sphere. You're positive energy. You're gravitationally pulling this sphere in on itself. But what's the sphere doing? Image credit: Take 27 LTD / Science Photo Library. It's expanding, and it's expanding outwards. In other words, you're (gravitationally) pulling inwards, which is the opposite direction as the expansion, and so you're doing (eb) negative work!
(4) In other words, yes, we are creating (eb) more space, and that space does have (e) energy intrinsic

to it.

(5) But in addition to the galaxies being less tightly bound as space expands, and in addition to the radiation being lower in energy as it continues to be redshifted, the negative work done by the existing energy-of-space as the Universe expands is (=) where the extra energy to create the new space comes from! If you want to dive into the technical details, I recommend this 1992 paper by Carroll, Press and Turner, which also derives the reason why dark energy needs to have a negative pressure to make this all work!

(6) So if you're asking where the energy for this "dark energy" comes from, it comes from (e) the negative work done on the expansion of the Universe.

(7) And that's why energy, if you choose to allow it to be defined, can be conserved (eb&e) even in a Universe with dark energy!

(8) Isotropy + Homogeneity ⇒ GR = FRW universe(See Caroll et al paper cited above by Ethan)

(9) H^2 = 8(pi)g/3 (rou) subscript (M) + (lambda) /(3) –k?a^2 (See paper cited above)

NOTATION

Module One

Application of a force upwards to a downwards moving object, you do (=) negative work. (I.e., you remove energy from the system.)

G_{13} : Category one of Application of a force upwards to a downwards moving object

G_{14} : Category two of SAS

G_{15} : Category three of SAS

T_{13} : Category one of negative work. (I.e., you remove energy from the system.)

T_{14} : Category two of SAS

G_{18} : Category three of SAS

T_{16} : Category one of energy to the system; negative work

T_{17} : Category two of SAS

T_{18} : Category three of SAS

Module three

You've got this sphere-like object expanding, and there you are, this constant energy density (i.e., dark

energy), and you fill the sphere. You're positive energy. You're gravitationally pulling this sphere in on itself. But what's the sphere doing? Image credit: Take 27 LTD / Science Photo Library. It's expanding, and it's expanding outwards. In other words, you're (gravitationally) pulling inwards, which is the opposite direction as the expansion, and so you're doing (eb) negative work!

G_{20} : Category one of(gravitationally) pulling inwards, which is the opposite direction as the expansion

G_{21} : Category two of SAS

G_{22} : Category three of SAS

T_{20} : Category one of negative work!

T_{21} : Category two of SAS

T_{22} : Category three of SAS

Module four

We are creating (eb) more space, and that space does have (e) energy intrinsic to it.

G_{24} : Category one of energy intrinsic to it.

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on

$G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 19 to 24 it results

$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right),\quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t), t) = (b_{15}')^{(1)}$

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^{0}}{G_{14}^{0}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)}+(C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

$$(\nu_1)^{(8)} \leq \nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\nu_0)^{(8)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(8)}(t)$:-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(8)}(t)$:-

$$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}, \quad \boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{40})^{(8)} = (a''_{41})^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)}G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b''_{40})^{(8)} = (b''_{41})^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then
$(u_1)^{(8)} = (\bar{u}_1)^{(8)}$ if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)}T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

424 A

Proof : From 99,20,44,22,23,44 we obtain

$$\frac{d\nu^{(9)}}{dt} = (a_{44})^{(9)} - \left((a'_{44})^{(9)} - (a'_{45})^{(9)} + (a''_{44})^{(9)}(T_{45}, t)\right) - (a''_{45})^{(9)}(T_{45}, t)\nu^{(9)} - (a_{45})^{(9)}\nu^{(9)}$$

Definition of $\nu^{(9)}$:- $\quad \boxed{\nu^{(9)} = \frac{G_{44}}{G_{45}}}$

It follows

$$-\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_2)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right) \leq \frac{d\nu^{(9)}}{dt} \leq -\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_1)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(9)}, (\nu_0)^{(9)}$:-

$$\text{For } 0 < \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}} < (\nu_1)^{(9)} < (\bar{\nu}_1)^{(9)}$$

$$\nu^{(9)}(t) \geq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}} \quad , \quad \boxed{(C)^{(9)} = \frac{(\nu_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\nu_2)^{(9)}}}$$

it follows $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\nu_9)^{(9)}$

In the same manner , we get

$$\nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(9)} = \frac{(\bar{\nu}_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\bar{\nu}_2)^{(9)}}}$$

From which we deduce $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\bar{\nu}_1)^{(9)}$

If $0 < (\nu_1)^{(9)} < (\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0} < (\bar{\nu}_1)^{(9)}$ we find like in the previous case,

$$(\nu_1)^{(9)} \leq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}} \leq \nu^{(9)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \leq (\bar{\nu}_1)^{(9)} \leq \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}}$, we obtain

$$(\nu_1)^{(9)} \leq \nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(9)}(t)$:-

$$(m_2)^{(9)} \leq \nu^{(9)}(t) \leq (m_1)^{(9)}, \quad \boxed{\nu^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(9)}(t)$:-

$$(\mu_2)^{(9)} \leq u^{(9)}(t) \leq (\mu_1)^{(9)}, \quad \boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

Particular case :

If $(a''_{44})^{(9)} = (a''_{45})^{(9)}, then\ (\sigma_1)^{(9)} = (\sigma_2)^{(9)}$ and in this case $(\nu_1)^{(9)} = (\bar{\nu}_1)^{(9)}$ if in addition $(\nu_0)^{(9)} = (\nu_1)^{(9)}$ then $\nu^{(9)}(t) = (\nu_0)^{(9)}$ and as a consequence $G_{44}(t) = (\nu_0)^{(9)} G_{45}(t)$ **this also defines** $(\nu_0)^{(9)}$ **for**

the special case .

Analogously if $(b''_{44})^{(9)} = (b''_{45})^{(9)}, then\ (\tau_1)^{(9)} = (\tau_2)^{(9)}$ and then
$(u_1)^{(9)} = (\bar{u}_1)^{(9)}$if in addition $(u_0)^{(9)} = (u_1)^{(9)}$ then $T_{44}(t) = (u_0)^{(9)}T_{45}(t)$ This is an important consequence of the relation between $(\nu_1)^{(9)}$ and $(\bar{\nu}_1)^{(9)}$, **and definition of** $(u_0)^{(9)}$.

Theorem 9: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(9)}\ and\ (b_i'')^{(9)}$ Belong to $C^{(9)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of $\mathbb{G}_i, \mathbb{T}_i$:-

$$G_i = G_i^* + \mathbb{G}_i \qquad , T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial(a''_{45})^{(9)}}{\partial T_{45}}(T^*_{45}) = (q_{45})^{(9)} \ , \ \frac{\partial(b''_i)^{(9)}}{\partial G_j}(\ (G_{47})^*\ ) = s_{ij}$$

Then taking into account equations 89 to 99 and neglecting the terms of power 2, we obtain from 99 to 44

$$\frac{d\mathbb{G}_{44}}{dt} = -\left((a'_{44})^{(9)} + (p_{44})^{(9)}\right)\mathbb{G}_{44} + (a_{44})^{(9)}\mathbb{G}_{45} - (q_{44})^{(9)}G^*_{44}\mathbb{T}_{45} \quad 586\ B$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

SECTION FIVE

GR, Curvature Couples Directly To The Energy-Momentum Tensor: Alis Grave Nil: Nothing Is Heavy To Those Who Have Wings".

INTRODUCTION—VARIABLES USED

Carroll, Press, & Turner ARAA 30, 499 (1992): Cosmological constant:

(1) In non-gravitational physics, only energy differences are (=) relevant. (Zero-point of potential energy may be selected arbitrarily; kinetic energy may be eliminated (e) by boosting to rest frame.)
(2) GR, curvature couples (e&eb) directly to the energy-momentum tensor!
(3) The universe is affected by (e&eb) the ground state of all non-gravitational fields.
(4) Gμν = 8πGT
(5) QM tells us that the ground state energy of a quadratic degree of freedom is(=)E0 = h¯ω/2
(6) In QFT we have (e) a continuum of states whose integral diverges!
(7) (da/d(tow)) = 1+ (sigma) (M) (1/a-1) + (sigma) (Lambda) (a^2-1)
(8) Redshift increasing with(e) distance
(9) galaxies are (=) distributed isotropically

And analogous inequalities for G_i *and* T_i. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ *and* $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13,14,15$ depend only on T_{14} and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(1)}t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$: (187)

Remark 3: if G_{13} is bounded, the same property have also G_{14} *and* G_{15} . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a'_{14})^{(1)}$$

In the same way , one can obtain

Indeed let t_1 be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t),t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

For $0 < \boxed{(v_0)^{(1)} = \frac{G^0_{13}}{G^0_{14}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$v^{(1)}(t) \le \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}}$$

From which we deduce $(v_0)^{(1)} \le v^{(1)}(t) \le (\bar{v}_1)^{(1)}$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{36})^{(7)} = (a''_{37})^{(7)}, then\ (\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(\nu_1)^{(7)} = (\bar{\nu}_1)^{(7)}$ if in addition $(\nu_0)^{(7)} = (\nu_1)^{(7)}$ then $\nu^{(7)}(t) = (\nu_0)^{(7)}$ and as a consequence $G_{36}(t) = (\nu_0)^{(7)}G_{37}(t)$ **this also defines** $(\nu_0)^{(7)}$ **for the special case** .

Analogously if $(b''_{36})^{(7)} = (b''_{37})^{(7)}, then\ (\tau_1)^{(7)} = (\tau_2)^{(7)}$ and then $(u_1)^{(7)} = (\bar{u}_1)^{(7)}$if in addition $(u_0)^{(7)} = (u_1)^{(7)}$ then $T_{36}(t) = (u_0)^{(7)}T_{37}(t)$ This is an important consequence of the relation between $(\nu_1)^{(7)}$ and $(\bar{\nu}_1)^{(7)}$, **and definition of** $(u_0)^{(7)}$.

Proof : From global equations we obtain 421

$$\frac{d\nu^{(8)}}{dt} = (a_{40})^{(8)} - \left((a'_{40})^{(8)} - (a'_{41})^{(8)} + (a''_{40})^{(8)}(T_{41}, t)\right) - (a''_{41})^{(8)}(T_{41}, t)\nu^{(8)} - (a_{41})^{(8)}\nu^{(8)}$$

Definition of $\nu^{(8)}$:- $\boxed{\nu^{(8)} = \frac{G_{40}}{G_{41}}}$

It follows

$$-\left((a_{41})^{(8)}\left(\nu^{(8)}\right)^2 + (\sigma_2)^{(8)}\nu^{(8)} - (a_{40})^{(8)}\right) \leq \frac{d\nu^{(8)}}{dt} \leq -\left((a_{41})^{(8)}\left(\nu^{(8)}\right)^2 + (\sigma_1)^{(8)}\nu^{(8)} - (a_{40})^{(8)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(8)}, (\nu_0)^{(8)}$:-

For $0 < \boxed{(\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0}} < (\nu_1)^{(8)} < (\bar{\nu}_1)^{(8)}$

$$\nu^{(8)}(t) \geq \frac{(\nu_1)^{(8)} + (C)^{(8)}(\nu_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_0)^{(8)}\right)t\right]}}{1 + (C)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_0)^{(8)}\right)t\right]}} \quad , \quad \boxed{(C)^{(8)} = \frac{(\nu_1)^{(8)} - (\nu_0)^{(8)}}{(\nu_0)^{(8)} - (\nu_2)^{(8)}}}$$

it follows $(\nu_0)^{(8)} \leq \nu^{(8)}(t) \leq (\nu_1)^{(8)}$

In the same manner , we get 422

$$\nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)} + (\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}}{1 + (\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(8)} = \frac{(\bar{\nu}_1)^{(8)} - (\nu_0)^{(8)}}{(\nu_0)^{(8)} - (\bar{\nu}_2)^{(8)}}}$$

From which we deduce $(\nu_0)^{(8)} \leq \nu^{(8)}(t) \leq (\bar{\nu}_8)^{(8)}$

If $0 < (\nu_1)^{(8)} < (\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0} < (\bar{\nu}_1)^{(8)}$ we find like in the previous case, 423

$$(\nu_1)^{(8)} \leq \frac{(\nu_1)^{(8)} + (C)^{(8)}(\nu_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_2)^{(8)}\right)t\right]}}{1 + (C)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_2)^{(8)}\right)t\right]}} \leq \nu^{(8)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(8)} + (\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}}{1 + (\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\bar{\nu}_1)^{(8)}$$

If $0 < (\nu_1)^{(8)} \leq (\bar{\nu}_1)^{(8)} \leq \boxed{(\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0}}$, we obtain 424

$$(\nu_1)^{(8)} \leq \nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)} + (\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}}{1 + (\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\nu_0)^{(8)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(8)}(t)$:-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(8)}(t)$:-

$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}$, $\boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{40})^{(8)} = (a''_{41})^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)} G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b''_{40})^{(8)} = (b''_{41})^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then
$(u_1)^{(8)} = (\bar{u}_1)^{(8)}$if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)} T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

Where in $(G_{43})(G_{40}, G_{41}, G_{42}), G_{40}, G_{42}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{41} taking into account the hypothesis $\varphi(0) > 0$, $\varphi(\infty) < 0$ it follows that there exists a unique G^*_{41} such that $\varphi({G_{43}}^*) = 0$

By the same argument, the equations 92,93 admit solutions G_{44}, G_{45} if
$\varphi(G_{47}) = (b'_{44})^{(9)}(b'_{45})^{(9)} - (b_{44})^{(9)}(b_{45})^{(9)} -$

$$\left[(b'_{44})^{(9)}(b''_{45})^{(9)}(G_{47}) + (b'_{45})^{(9)}(b''_{44})^{(9)}(G_{47})\right]+(b''_{44})^{(9)}(G_{47})(b''_{45})^{(9)}(G_{47}) = 0$$

Where in $(G_{47})(G_{44}, G_{45}, G_{46}), G_{44}, G_{46}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{45} taking into account the hypothesis $\varphi(0) > 0$, $\varphi(\infty) < 0$ it follows that there exists a unique G^*_{45} such that $\varphi((G_{47})^*) = 0$

Finally we obtain the unique solution 511

G_{14}^* given by $\varphi(G^*) = 0$, T_{14}^* given by $f(T_{14}^*) = 0$ and

$$G_{13}^* = \frac{(a_{13})^{(1)} G_{14}^*}{[(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14}^*)]} \quad , \quad G_{15}^* = \frac{(a_{15})^{(1)} G_{14}^*}{[(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14}^*)]}$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

INTRODUCTION—VARIABLES USED

Entanglement-assisted capacity of a quantum channel and the reverse Shannon theorem Bennett, C.H.

(1) The entanglement-assisted classical capacity of a noisy quantum channel (CE) is (=) the amount of information per channel use that can be sent over the channel in the limit of many uses of the channel, assuming (eb) that the sender and receiver have (e) access to the resource of shared quantum entanglement, which may be used up (e) by the communication protocol

(2) The entanglement-assisted classical capacity of a noisy quantum channel (CE) is (=) the amount of information per channel use that can be sent over the channel in the limit of many uses of the channel, assuming (eb) that the sender and receiver have (e) access to the resource of shared quantum entanglement, which may be used up (e) by the communication protocol

(3) The entanglement-assisted classical capacity of a noisy quantum channel (CE) is (=) the amount of information per channel use that can be sent over the channel in the limit of many uses of the channel, assuming (eb) that the sender and receiver have (e) access to the resource of shared quantum entanglement, which may be used up (e) by the communication protocol

(4) Authors show that the capacity CE is (=) given by an expression parallel to that for the capacity of a purely classical channel: i.e., the maximum, over channel inputs ρ, of the entropy of the channel input plus the entropy of the channel output minus their joint entropy, the latter being defined as the entropy of an entangled purification of ρ after half of it has passed through the channel.

(5) They calculate entanglement-assisted capacities for (e) two interesting quantum channels, the qubit amplitude damping channel and the bosonic channel with amplification/attenuation and Gaussian noise.

(6) Authors discuss how many independent parameters are required (e) to completely characterize (eb) the asymptotic behavior of a general quantum channel, alone or in the (eb) presence of ancillary resources such as prior entanglement.

(7) In the classical analog of entanglement-assisted communication - communication over a discrete memoryless channel (DMC) between parties who share prior random information - authors show that one parameter is sufficient, i.e., that in the presence of prior shared random information, all DMCs of equal capacity can simulate(e&eb) one another with unit asymptotic efficiency. Where $s_{(13)}$ represents integrand that is integrated over the interval $[0,\mathrm{t}]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\widehat{M}_{13})^{(1)}t}\leq \quad 186$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\widehat{A}_{13})^{(1)}+(\widehat{P}_{13})^{(1)}(\hat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}\ and\ (\widehat{Q}_{13})^{(1)}e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i=13{,}14{,}15$ depend only on T_{14} and respectively on

$G(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 19 to 24 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i\,(t) \geq T_i^0 e^{\left(-(b_i')^{(1)} t\right)} > 0 \quad \text{for t} > 0$$

Definition of $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$: 187

Remark 3: if G_{13} is bounded, the same property have also $G_{14}\ and\ G_{15}$. indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2 / (a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If $G_{13}\ \ is$ bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$. The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 188

Remark 5: If T_{13} is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t), t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

Definition of $(m)^{(1)}$ and ε_1 :

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}\,(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded.
The same property holds for T_{15} if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

Definition of $\nu^{(3)}(t)$:-

$$(m_2)^{(3)} \leq \nu^{(3)}(t) \leq (m_1)^{(3)}, \quad \boxed{\nu^{(3)}(t) = \frac{G_{20}(t)}{G_{21}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(3)}(t)$:-

$$(\mu_2)^{(3)} \leq u^{(3)}(t) \leq (\mu_1)^{(3)}, \quad \boxed{u^{(3)}(t) = \frac{T_{20}(t)}{T_{21}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a_{20}'')^{(3)} = (a_{21}'')^{(3)}, then\ (\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(\nu_1)^{(3)} = (\bar{\nu}_1)^{(3)}$ if in addition $(\nu_0)^{(3)} = (\nu_1)^{(3)}$ then $\nu^{(3)}(t) = (\nu_0)^{(3)}$ and as a consequence $G_{20}(t) = (\nu_0)^{(3)}G_{21}(t)$

Analogously if $(b_{20}'')^{(3)} = (b_{21}'')^{(3)}, then\ (\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)}T_{21}(t)$ This is an important consequence of the relation between $(\nu_1)^{(3)}$ and $(\bar{\nu}_1)^{(3)}$

Proof : From global equations we obtain 404

$$\frac{d\nu^{(4)}}{dt} = (a_{24})^{(4)} - \left((a_{24}')^{(4)} - (a_{25}')^{(4)} + (a_{24}'')^{(4)}(T_{25},t)\right) - (a_{25}'')^{(4)}(T_{25},t)\nu^{(4)} - (a_{25})^{(4)}\nu^{(4)}$$

Definition of $\nu^{(4)}$:- $\boxed{\nu^{(4)} = \frac{G_{24}}{G_{25}}}$

It follows

$$-\left((a_{25})^{(4)}\left(\nu^{(4)}\right)^2 + (\sigma_2)^{(4)}\nu^{(4)} - (a_{24})^{(4)}\right) \leq \frac{d\nu^{(4)}}{dt} \leq -\left((a_{25})^{(4)}\left(\nu^{(4)}\right)^2 + (\sigma_4)^{(4)}\nu^{(4)} - (a_{24})^{(4)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(4)}, (\nu_0)^{(4)}$:-

For $0 < \boxed{(\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}} < (\nu_1)^{(4)} < (\bar{\nu}_1)^{(4)}$

$$\nu^{(4)}(t) \geq \frac{(\nu_1)^{(4)} + (C)^{(4)}(\nu_2)^{(4)} e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_0)^{(4)}\right)t\right]}}{4 + (C)^{(4)} e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_0)^{(4)}\right)t\right]}} \quad , \quad \boxed{(C)^{(4)} = \frac{(\nu_1)^{(4)} - (\nu_0)^{(4)}}{(\nu_0)^{(4)} - (\nu_2)^{(4)}}}$$

it follows $(\nu_0)^{(4)} \leq \nu^{(4)}(t) \leq (\nu_1)^{(4)}$

In the same manner , we get 405

$$\nu^{(4)}(t) \leq \frac{(\bar{\nu}_1)^{(4)} + (\bar{C})^{(4)}(\bar{\nu}_2)^{(4)} e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)} - (\bar{\nu}_2)^{(4)}\right)t\right]}}{4 + (\bar{C})^{(4)} e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)} - (\bar{\nu}_2)^{(4)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(4)} = \frac{(\bar{\nu}_1)^{(4)} - (\nu_0)^{(4)}}{(\nu_0)^{(4)} - (\bar{\nu}_2)^{(4)}}}$$

From which we deduce $(\nu_0)^{(4)} \leq \nu^{(4)}(t) \leq (\bar{\nu}_1)^{(4)}$

If $0 < (\nu_1)^{(4)} < (\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{\nu}_1)^{(4)}$ we find like in the previous case, 406

$$(\nu_1)^{(4)} \leq \frac{(\nu_1)^{(4)} + (C)^{(4)}(\nu_2)^{(4)} e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_2)^{(4)}\right)t\right]}}{1 + (C)^{(4)} e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_2)^{(4)}\right)t\right]}} \leq \nu^{(4)}(t) \leq$$

If $0 < (\nu_1)^{(4)} \leq (\bar{\nu}_1)^{(4)} \leq \boxed{(\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}}$, we obtain 407

$$(\nu_1)^{(4)} \leq \nu^{(4)}(t) \leq \frac{(\bar{\nu}_1)^{(4)} + (\bar{C})^{(4)}(\bar{\nu}_2)^{(4)} e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)} - (\bar{\nu}_2)^{(4)}\right)t\right]}}{1 + (\bar{C})^{(4)} e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)} - (\bar{\nu}_2)^{(4)}\right)t\right]}} \leq (\nu_0)^{(4)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(4)}(t)$:-

$$(m_2)^{(4)} \leq \nu^{(4)}(t) \leq (m_1)^{(4)}, \quad \boxed{\nu^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}}$$

Definition of $(\bar{\nu}_1)^{(8)}, (\nu_0)^{(8)}$:-

For $0 < \boxed{(\nu_0)^{(8)} = \frac{G^0_{40}}{G^0_{41}}} < (\nu_1)^{(8)} < (\bar{\nu}_1)^{(8)}$

$$\nu^{(8)}(t) \geq \frac{(\nu_1)^{(8)} + (C)^{(8)}(\nu_2)^{(8)} e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_0)^{(8)}\right)t\right]}}{1 + (C)^{(8)} e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)} - (\nu_0)^{(8)}\right)t\right]}} \quad , \quad \boxed{(C)^{(8)} = \frac{(\nu_1)^{(8)} - (\nu_0)^{(8)}}{(\nu_0)^{(8)} - (\nu_2)^{(8)}}}$$

it follows $(\nu_0)^{(8)} \leq \nu^{(8)}(t) \leq (\nu_1)^{(8)}$

In the same manner , we get 422

$$\nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)} + (\bar{C})^{(8)}(\bar{\nu}_2)^{(8)} e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}}{1 + (\bar{C})^{(8)} e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(8)} = \frac{(\bar{\nu}_1)^{(8)} - (\nu_0)^{(8)}}{(\nu_0)^{(8)} - (\bar{\nu}_2)^{(8)}}}$$

From which we deduce $(\nu_0)^{(8)} \leq \nu^{(8)}(t) \leq (\bar{\nu}_8)^{(8)}$

If $0 < (\nu_1)^{(8)} < (\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0} < (\bar{\nu}_1)^{(8)}$ we find like in the previous case, 423

$$(\nu_1)^{(8)} \leq \frac{(\nu_1)^{(8)}+(C)^{(8)}(\nu_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)}-(\nu_2)^{(8)}\right)t\right]}}{1+(C)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)}-(\nu_2)^{(8)}\right)t\right]}} \leq \nu^{(8)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\bar{\nu}_1)^{(8)}$$

If $0 < (\nu_1)^{(8)} \leq (\bar{\nu}_1)^{(8)} \leq \boxed{(\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0}}$, we obtain 424

$$(\nu_1)^{(8)} \leq \nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\nu_0)^{(8)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(8)}(t)$:-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(8)}(t)$:-

$$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}, \quad \boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{40})^{(8)} = (a''_{41})^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)}G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b''_{40})^{(8)} = (b''_{41})^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then
$(u_1)^{(8)} = (\bar{u}_1)^{(8)}$ if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)}T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

424 A

Proof : From 99,20,44,22,23,44 we obtain

$$\frac{d\nu^{(9)}}{dt} = (a_{44})^{(9)} - \left((a'_{44})^{(9)} - (a'_{45})^{(9)} + (a''_{44})^{(9)}(T_{45}, t)\right) - (a''_{45})^{(9)}(T_{45}, t)\nu^{(9)} - (a_{45})^{(9)}\nu^{(9)}$$

Definition of $\nu^{(9)}$:- $\boxed{\nu^{(9)} = \frac{G_{44}}{G_{45}}}$

It follows

$$-\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_2)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right) \leq \frac{d\nu^{(9)}}{dt} \leq -\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_1)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right)$$

From which one obtains

Definition of $(\bar{\nu}_1)^{(9)}, (\nu_0)^{(9)}$:-

$$\text{For } 0 < \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}} < (\nu_1)^{(9)} < (\bar{\nu}_1)^{(9)}$$

$$\nu^{(9)}(t) \geq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}} \quad , \quad \boxed{(C)^{(9)} = \frac{(\nu_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\nu_2)^{(9)}}}$$

it follows $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\nu_9)^{(9)}$

In the same manner , we get

$$\nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(9)} = \frac{(\bar{\nu}_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\bar{\nu}_2)^{(9)}}}$$

From which we deduce $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\bar{\nu}_1)^{(9)}$

If $0 < (\nu_1)^{(9)} < (\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0} < (\bar{\nu}_1)^{(9)}$ we find like in the previous case,

$$(\nu_1)^{(9)} \leq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}} \leq \nu^{(9)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \leq (\bar{\nu}_1)^{(9)} \leq \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}}$, we obtain

$$(\nu_1)^{(9)} \leq \nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $\nu^{(9)}(t)$:-

$$(m_2)^{(9)} \leq \nu^{(9)}(t) \leq (m_1)^{(9)}, \quad \boxed{\nu^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

$$(\mu_2)^{(9)} \leq u^{(9)}(t) \leq (\mu_1)^{(9)}, \quad \boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

Particular case :

ASYMPTOTIC STABILITY ANALYSIS

Theorem 8: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(8)}$ *and* $(b_i'')^{(8)}$ Belong to $C^{(8)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of $\mathbb{G}_i, \mathbb{T}_i$:- 580

$$G_i = G_i^{*} + \mathbb{G}_i \qquad , T_i = T_i^{*} + \mathbb{T}_i$$

$$\frac{\partial(a_{41}'')^{(8)}}{\partial T_{41}}(T_{41}^{*}) = (q_{41})^{(8)} \quad , \frac{\partial(b_i'')^{(8)}}{\partial G_j}\left((G_{43})^{*} \right) = s_{ij}$$

Then taking into account equations and neglecting the terms of power 2, we obtain

$$\frac{d\mathbb{G}_{40}}{dt} = -\left((a_{40}')^{(8)} + (p_{40})^{(8)}\right)\mathbb{G}_{40} + (a_{40})^{(8)}\mathbb{G}_{41} - (q_{40})^{(8)}G_{40}^{*}\mathbb{T}_{41} \quad 581$$

$$\left(\left((\lambda)^{(9)}+(b'_{44})^{(9)}-(r_{44})^{(9)}\right)s_{(45),(44)}T^*_{45}+(b_{45})^{(9)}s_{(44),(44)}T^*_{44}\right)$$

$$\left(\left((\lambda)^{(9)}\right)^2+\left((a'_{44})^{(9)}+(a'_{45})^{(9)}+(p_{44})^{(9)}+(p_{45})^{(9)}\right)(\lambda)^{(9)}\right)$$

$$\left(\left((\lambda)^{(9)}\right)^2+\left((b'_{44})^{(9)}+(b'_{45})^{(9)}-(r_{44})^{(9)}+(r_{45})^{(9)}\right)(\lambda)^{(9)}\right)$$

$$+\left(\left((\lambda)^{(9)}\right)^2+\left((a'_{44})^{(9)}+(a'_{45})^{(9)}+(p_{44})^{(9)}+(p_{45})^{(9)}\right)(\lambda)^{(9)}\right)(q_{46})^{(9)}G_{46}$$

$$+\left((\lambda)^{(9)}+(a'_{44})^{(9)}+(p_{44})^{(9)}\right)\left((a_{46})^{(9)}(q_{45})^{(9)}G^*_{45}+(a_{45})^{(9)}(a_{46})^{(9)}(q_{44})^{(9)}G^*_{44}\right)$$

$$\left(\left((\lambda)^{(9)}+(b'_{44})^{(9)}-(r_{44})^{(9)}\right)s_{(45),(46)}T^*_{45}+(b_{45})^{(9)}s_{(44),(46)}T^*_{44}\right)\}=0$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

Photonic Entanglement In High-Dimensional Hilbert Spaces: Beatus Homo Qui Invenit Sapientiam: Blessed Is The Man Who Finds Wisdom

INTRODUCTION—VARIABLES USED

Tailoring photonic entanglement in high-dimensional Hilbert spaces Phys. Rev. A 69, 050304(R) – Published 18 May 2004Hugues de Riedmatten et al

(1) Authors present an experiment where two photonic systems of (e) arbitrary dimensions can be entangled.
(2) The method is based on (e) spontaneous parametric down-conversion with trains of d pump pulses with a fixed phase relation, generated by (e) a mode-locked laser.
(3) The method is based on (e) spontaneous parametric down-conversion with trains of d pump pulses with a fixed phase relation, generated by (e) a mode-locked laser
(4) This leads to a photon pair created in (eb) a coherent superposition of d discrete emission times, given by (e) the successive laser pulses.
(5) This leads to a photon pair created in (eb) a coherent superposition of d discrete emission times, given by (e) the successive laser pulses
(6) Entanglement is shown by performing a two-photon interference experiment and by observing the visibility of the interference fringes increasing as (=) functions of the dimension d.
(7) Factors limiting (e) the visibility, such as the presence of multiple pairs in one train, are discussed. DOI: http://dx.doi.org/10.1103/PhysRevA.69.050304 Received 1 September 2003Published 18 May 2004 © 2004 The American Physical Society

Generation of Hyperentangled photon Pairs Phys. Rev. Lett. 95, 260501 – Published 19 December 2005 Julio T. Barreiro et al

(8) Authors experimentally demonstrate the first quantum system entangled in (e&eb) every degree of freedom (hyperentangled).

(9) Using pairs of photons produced in spontaneous parametric down-conversion, they verify entanglement by observing a Bell-type inequality violation (e) in each degree of freedom: polarization, spatial mode, and time energy.

Teleportation Of Qubits At Telecommunication Wavelengths: Bis Dat Qui Cito Dat: He Gives Twice, Who Gives Promptly

INTRODUCTION—VARIABLES USED

Nature 421, 509-513 (30 January 2003) | doi: 10.1038/nature01376; Received 19 September 2002; Accepted 13 December 2002 Long-distance teleportation of qubits at telecommunication wavelengths I. Marcikic et al

(1) Matter and energy cannot (e) be teleported (that is, transferred from one place to another without passing through intermediate locations).
(2) However, teleportation of quantum states (the ultimate structure of objects) is (=) possible1: only the structure is (=) teleported—the matter stays at the source side and must be already present at the final location.
(3) Several table-top experiments have used (e) qubits2, 3, 4, 5, 6, 7 (two-dimensional quantum systems) or continuous variables8, 9, 10 to demonstrate the principle over short distances.
(4) Here authors report a long-distance experimental demonstration of probabilistic quantum teleportation. Qubits carried by photons of 1.3 microm wavelength are (=) teleported onto photons of 1.55 microm wavelength from one laboratory to another, separated by 55 m but connected by 2 km of standard telecommunications fibre.
(5) The first (and, with foreseeable technologies, the only) application of quantum teleportation is (=) in quantum communication, where it could help (e) to extend quantum cryptography to larger distances11, 12, 13.

Mixed-State Entanglement and Distillation: Is there a "Bound" Entanglement in Nature? Phys. Rev. Lett. 80, 5239 – Published 15 June 1998 Michał Horodecki et al

(7) It is shown that if a mixed state can be distilled to the singlet form it must violate (e) partial transposition criterion [A. Peres, Phys. Rev. Lett. 76, 1413 (1996)].
(8) It implies (eb) that there are two qualitatively different types of entanglement: "free" entanglement which is distillable, and (e&eb) "bound" entanglement which cannot be brought to the singlet from

useful for quantum communication purposes.

(9) It implies (eb) that there are two qualitatively different types of entanglement: "free" entanglement which is distillable, and (e&eb) "bound" entanglement which cannot be brought to the singlet from useful for quantum communication purposes A possible physical meaning of the result is discussed.
