$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14},t)\right) - (a''_{14})^{(1)}(T_{14},t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

**Definition of** $v^{(1)}$ :- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

**Definition of** $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$ :-

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)}+(C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$ , we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(1)}(t)$ :-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(1)}(t)$ :-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)}G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important

consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

**Proof** : From global equations we obtain 387

$$\frac{d\nu^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t)\right) - (a''_{17})^{(2)}(T_{17}, t)\nu^{(2)} - (a_{17})^{(2)}\nu^{(2)}$$

**Theorem 4:** If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(1)}$ *and* $(b_i'')^{(1)}$ Belong to $C^{(1)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

**Proof:** Denote

**Definition of** $\mathbb{G}_i, \mathbb{T}_i$ :-

$$G_i = G_i^* + \mathbb{G}_i \qquad , T_i = T_i^* + \mathbb{T}_i$$

## Quantum Chaos With Quantum Tomography

### INTRODUCTION—VARIABLES USED

**Quantum Chaos and Quantum Computing Structures Carlos Pedro Gonçalves (Submitted on 13 Aug 2012)**

(1) A system of quantum computing structures is introduced and proven capable of making emerge, on average, the orbits of classical bounded nonlinear maps on (e&eb) \mathbb{C} through (e&eb)the

iterative action of path-dependent quantum gates.

(2) The effects of emerging nonlinear dynamics and chaos upon the (e&eb) quantum averages of relevant observables and quantum probabilities are exemplified for a version of Chirikov's standard map on \mathbb{C} .

(3) Both the individual orbits and ensemble properties are addressed so that (e) the Poincar\'e map for (e) Chirikov's standard map, in the current quantum setting, is reinterpreted in terms of (e&eb) a quantum ensemble which is then formally introduced within (eb) the formalized system of quantum computing structures, in terms of (e&eb) quantum register machines, revealing (eb) three phases of quantum ensemble dynamics: the regular, the chaotic and an intermediate phase called **complex quantum stochastic phase** which shares similarities to (e&eb) the edge of chaos notion from (e) classical cellular automata and classical random boolean networks' evolutionary computation. **Quantum Computing of Quantum Chaos in the Kicked Rotator Model B. Levi, B. Georgeot, D.L. Shepelyansky (Univ. P.Sabatier/CNRS, Toulouse)**

**(4)** **Authors** investigate a quantum algorithm which simulates efficiently the quantum kicked rotator model, a system which displays rich physical properties, and enables to study problems of quantum chaos, atomic physics and localization of electrons in solids.

**(5)** The effects of errors in gate operations are tested on this algorithm in numerical simulations with up to 20 qubits. In this way various physical quantities are investigated.

**(6)** Some of them, such as second moment of probability distribution and tunneling transitions through invariant curves are shown to be particularly sensitive to errors.

**(7)** However, investigations of the fidelity and Wigner and Husimi distributions show that these physical quantities are robust in presence of imperfections.

**(8)** This implies that the algorithm can simulate the dynamics of quantum chaos in presence of a moderate amount of noise. **Characterizing and Quantifying Quantum Chaos with Quantum Tomography Vaibhav Madhok, Carlos A. Riofrío, Ivan H. Deutsch**

(1) Authors explore quantum signatures of (e) classical chaos by studying the rate of information gain in (eb) quantum tomography.

(2) The tomographic record consists of (e) a time series of expectation values of (e) a Hermitian operator evolving under (e&eb) application of the Floquet operator of a quantum map that possesses (or lacks) (e&eb) time reversal symmetry.

(3) They find that the rate of information gain, and hence the fidelity of quantum state reconstruction, depends on (=) the symmetry class of the quantum map involved.

**(4)** Moreover, authors find an increase in information gain and hence higher reconstruction fidelities when (e) the Floquet maps employed increase in (eb) chaoticity.

**(5)** Authors make predictions for (e) the information gain and show that (eb) these results are well described by (e) random matrix theory in (eb) the fully chaotic regime.

**(6)** Authors derive analytical expressions for (e) bounds on information gain using (e) random matrix theory for (e) different class of maps and show that these bounds are realized by (e) fully chaotic quantum systems. **Cite as: arXiv: 1506.02708 [quant-ph] (or arXiv: 1506.02708v1 [quant-**

**Quantum chaos in ultracold collisions between Yb(1S0) and Yb(3P2) Dermot G. Green, Christophe L. Vaillant, Matthew D. Frye, Masato Morita, Jeremy M. Hutson**

(7) Authors calculate and analyze Feshbach resonance spectra for (e) ultracold Yb (1S0) + Yb (3P2) collisions as a function of (e) an interatomic potential scaling factor λ and external magnetic field.
(8) Authors show that, at zero fields, the resonances are distributed randomly in (eb) λ, but that signatures of quantum chaos emerge (eb) as a field is applied.
**(9)** The random zero-field distribution arises from (e) superposition of structured spectra associated with (e&eb) individual total angular momenta.
**(10)** In addition, they show that the resonances in magnetic field in the experimentally accessible range 400 to 2000~G are (=) chaotically distributed, with (e&eb) strong level repulsion that is (=) characteristic of quantum chaos. **Cite as: arXiv: 1510.06992 [physics.atom-ph] (or arXiv: 1510.06992v1 [physics.atom-ph] for this version) ©American Physical Society**

**Remark 1:** The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)} t}$ *and* $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)} t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(1)}$ and $(b''_i)^{(1)}, i = 13{,}14{,}15$ depend only on $T_{14}$ and respectively on $G$(*and not on* $t$) and hypothesis can replaced by a usual Lipschitz condition.

**Remark 2:** There does not exist any $t$ where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a'_i)^{(1)} - (a''_i)^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b'_i)^{(1)} t\right)} > 0 \quad \text{for t} > 0$$

**Definition of** $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$ : (187)

**Remark 3**: if $G_{13}$ is bounded, the same property have also $G_{14}$ *and* $G_{15}$ . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a'_{14})^{(1)}$$

In the same way , one can obtain

$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2/(a'_{15})^{(1)}$

In order that the operator $\mathcal{A}^{(7)}$ transforms the space of sextuples of functions $G_i, T_i$ satisfying

Equations into itself
The operator $\mathcal{A}^{(7)}$ is a contraction with respect to the metric 258

$$d\left(((G_{39})^{(1)},(T_{39})^{(1)}),((G_{39})^{(2)},(T_{39})^{(2)})\right)=$$
$$\sup_i\{\max_{t\in\mathbb{R}_+}|G_i^{(1)}(t)-G_i^{(2)}(t)|e^{-(\widehat{M}_{36})^{(7)}t},\max_{t\in\mathbb{R}_+}|T_i^{(1)}(t)-T_i^{(2)}(t)|e^{-(\widehat{M}_{36})^{(7)}t}\}$$

Indeed if we denote

**Definition of** $\widetilde{(G_{39})},\widetilde{(T_{39})}:\left(\widetilde{(G_{39})},\widetilde{(T_{39})}\right)=\mathcal{A}^{(7)}((G_{39}),(T_{39}))$
It results

$$|\tilde{G}_{36}^{(1)}-\tilde{G}_i^{(2)}|\le\int_0^t(a_{36})^{(7)}|G_{37}^{(1)}-G_{37}^{(2)}|e^{-(\widehat{M}_{36})^{(7)}s_{(36)}}e^{(\widehat{M}_{36})^{(7)}s_{(36)}}ds_{(36)}+$$
$$\int_0^t\{(a'_{36})^{(7)}|G_{36}^{(1)}-G_{36}^{(2)}|e^{-(\widehat{M}_{36})^{(7)}s_{(36)}}e^{-(\widehat{M}_{36})^{(7)}s_{(36)}}+$$
$$(a''_{36})^{(7)}(T_{37}^{(1)},s_{(36)})|G_{36}^{(1)}-G_{36}^{(2)}|e^{-(\widehat{M}_{36})^{(7)}s_{(36)}}e^{(\widehat{M}_{36})^{(7)}s_{(36)}}+$$

Where $s_{(36)}$ represents integrand that is integrated over the interval $[0,t]$

From the hypotheses on it follows

$$|(G_{39})^{(1)}-(G_{39})^{(2)}|e^{-(\widehat{M}_{36})^{(7)}t}\le$$ 259
$$\frac{1}{(\widehat{M}_{36})^{(7)}}((a_{36})^{(7)}+(a'_{36})^{(7)}+(\widehat{A}_{36})^{(7)}+(\widehat{P}_{36})^{(7)}(\widehat{k}_{36})^{(7)})d\left(((G_{39})^{(1)},(T_{39})^{(1)};\ (G_{39})^{(2)},(T_{39})^{(2)})\right)$$

And analogous inequalities for $G_i$ *and* $T_i$. Taking into account the hypothesis the result follows

**Remark 31:** The fact that we supposed $(a''_{36})^{(7)}$ and $(b''_{36})^{(7)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{36})^{(7)}e^{(\widehat{M}_{36})^{(7)}t}$ *and* $(\widehat{Q}_{36})^{(7)}e^{(\widehat{M}_{36})^{(7)}t}$ respectively of $\mathbb{R}_+$. 260

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(7)}$ and $(b_i'')^{(7)}, i=36,37,38$ depend only on $T_{37}$ and respectively on $(G_{39})(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 32:** There does not exist any $t$ where $G_i(t)=0\ and\ T_i(t)=0$ 261

it results

$$G_i(t)\ge G_i^0e^{\left[-\int_0^t\{(a_i')^{(7)}-(a_i'')^{(7)}(T_{37}(s_{(36)}),s_{(36)})\}ds_{(36)}\right]}\ge 0$$

$$T_i(t)\ge T_i^0e^{(-(b_i')^{(7)}t)}>0\quad \text{for t}>0$$

**Definition of** $\left((\widehat{M}_{36})^{(7)}\right)_1, \left((\widehat{M}_{36})^{(7)}\right)_2$ *and* $\left((\widehat{M}_{36})^{(7)}\right)_3$ : 262

**Remark 33:** if $G_{36}$ is bounded, the same property have also $G_{37}$ *and* $G_{38}$ . indeed if

$G_{36} < (\widehat{M}_{36})^{(7)}$ it follows $\frac{dG_{37}}{dt} \leq \left((\widehat{M}_{36})^{(7)}\right)_1 - (a'_{37})^{(7)} G_{37}$ and by integrating

$G_{37} \leq \left((\widehat{M}_{36})^{(7)}\right)_2 = G_{37}^0 + 2(a_{37})^{(7)}\left((\widehat{M}_{36})^{(7)}\right)_1/(a'_{37})^{(7)}$

In the same way , one can obtain

$G_{38} \leq \left((\widehat{M}_{36})^{(7)}\right)_3 = G_{38}^0 + 2(a_{38})^{(7)}\left((\widehat{M}_{36})^{(7)}\right)_2/(a'_{38})^{(7)}$

If $G_{37}$ *or* $G_{38}$ is bounded, the same property follows for $G_{36}$ , $G_{38}$ and $G_{36}$ , $G_{37}$ respectively.

**Remark 34:** If $G_{36}$ *is* bounded, from below, the same property holds for $G_{37}$ *and* $G_{38}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{37}$ is bounded from below. 263

**Remark 35:** If $T_{36}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(7)}((G_{39})(t),t)) = (b'_{37})^{(7)}$ then $T_{37} \to \infty$. 264

**Definition of** $(m)^{(7)}$ and $\varepsilon_7$ :

Indeed let $t_7$ be so that for $t > t_7$

$(b_{37})^{(7)} - (b_i'')^{(7)}((G_{39})(t),t) < \varepsilon_7, T_{36}(t) > (m)^{(7)}$

Then $\frac{dT_{37}}{dt} \geq (a_{37})^{(7)}(m)^{(7)} - \varepsilon_7 T_{37}$ which leads to 265

$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{\varepsilon_7}\right)(1 - e^{-\varepsilon_7 t}) + T_{37}^0 e^{-\varepsilon_7 t}$ If we take t such that $e^{-\varepsilon_7 t} = \frac{1}{2}$ it results

$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{2}\right), \quad t = log\frac{2}{\varepsilon_7}$ By taking now $\varepsilon_7$ sufficiently small one sees that $T_{37}$ is unbounded.
The same property holds for $T_{38}$ if $\lim_{t\to\infty}(b_{38}'')^{(7)}\left((G_{39})(t),t\right) = (b'_{38})^{(7)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(8)}}{(\hat{M}_{40})^{(8)}}$ , $\frac{(b_i)^{(8)}}{(\hat{M}_{40})^{(8)}} < 1$ and to choose 266

For $0<\boxed{(v_0)^{(1)}=\frac{G_{13}^{0}}{G_{14}^{0}}}<(v_1)^{(1)}<(\bar{v}_1)^{(1)}$

$$v^{(1)}(t)\geq\frac{(v_1)^{(1)}+(C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}\quad,\quad\boxed{(C)^{(1)}=\frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(v_0)^{(1)}\leq v^{(1)}(t)\leq(v_1)^{(1)}$

In the same manner , we get 384

$$v^{(1)}(t)\leq\frac{(\bar{v}_1)^{(1)}+(\bar{C})^{(1)}(\bar{v}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)}-(\bar{v}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)}-(\bar{v}_2)^{(1)}\right)t\right]}}\quad,\quad\boxed{(\bar{C})^{(1)}=\frac{(\bar{v}_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(\bar{v}_2)^{(1)}}}$$

From which we deduce $(v_0)^{(1)}\leq v^{(1)}(t)\leq(\bar{v}_1)^{(1)}$

If $0<(v_1)^{(1)}<(v_0)^{(1)}=\frac{G_{13}^{0}}{G_{14}^{0}}<(\bar{v}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \le \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \le \nu^{(1)}(t) \le$$

**Proof** : From global equations we obtain 404

$$\frac{d\nu^{(4)}}{dt} = (a_{24})^{(4)} - \left((a_{24}')^{(4)} - (a_{25}')^{(4)} + (a_{24}'')^{(4)}(T_{25},t)\right) - (a_{25}'')^{(4)}(T_{25},t)\nu^{(4)} - (a_{25})^{(4)}\nu^{(4)}$$

**Definition of** $\nu^{(4)}$ :- $\quad \boxed{\nu^{(4)} = \frac{G_{24}}{G_{25}}}$

It follows

$$-\left((a_{25})^{(4)}\left(\nu^{(4)}\right)^2 + (\sigma_2)^{(4)}\nu^{(4)} - (a_{24})^{(4)}\right) \le \frac{d\nu^{(4)}}{dt} \le -\left((a_{25})^{(4)}\left(\nu^{(4)}\right)^2 + (\sigma_4)^{(4)}\nu^{(4)} - (a_{24})^{(4)}\right)$$

From which one obtains

**Definition of** $(\bar{\nu}_1)^{(4)}, (\nu_0)^{(4)}$ :-

For $0 < \boxed{(\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}} < (\nu_1)^{(4)} < (\bar{\nu}_1)^{(4)}$

$$\nu^{(4)}(t) \geq \frac{(\nu_1)^{(4)}+(C)^{(4)}(\nu_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_0)^{(4)}\right)t\right]}}{4+(C)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_0)^{(4)}\right)t\right]}} \quad , \quad \boxed{(C)^{(4)} = \frac{(\nu_1)^{(4)}-(\nu_0)^{(4)}}{(\nu_0)^{(4)}-(\nu_2)^{(4)}}}$$

it follows $(\nu_0)^{(4)} \leq \nu^{(4)}(t) \leq (\nu_1)^{(4)}$

In the same manner , we get 405

$$\nu^{(4)}(t) \leq \frac{(\bar{\nu}_1)^{(4)}+(\bar{C})^{(4)}(\bar{\nu}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}}{4+(\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(4)} = \frac{(\bar{\nu}_1)^{(4)}-(\nu_0)^{(4)}}{(\nu_0)^{(4)}-(\bar{\nu}_2)^{(4)}}}$$

From which we deduce $(\nu_0)^{(4)} \leq \nu^{(4)}(t) \leq (\bar{\nu}_1)^{(4)}$

If $0 < (\nu_1)^{(4)} < (\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{\nu}_1)^{(4)}$ we find like in the previous case, 406

$$(\nu_1)^{(4)} \leq \frac{(\nu_1)^{(4)}+(C)^{(4)}(\nu_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_2)^{(4)}\right)t\right]}}{1+(C)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_2)^{(4)}\right)t\right]}} \leq \nu^{(4)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(4)}+(\bar{C})^{(4)}(\bar{\nu}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}}{1+(\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}} \leq (\bar{\nu}_1)^{(4)}$$

If $0 < (\nu_1)^{(4)} \leq (\bar{\nu}_1)^{(4)} \leq \boxed{(\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}}$ , we obtain 407

$$(\nu_1)^{(4)} \leq \nu^{(4)}(t) \leq \frac{(\bar{\nu}_1)^{(4)}+(\bar{C})^{(4)}(\bar{\nu}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}}{1+(\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}} \leq (\nu_0)^{(4)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(4)}(t)$ :-

$$(m_2)^{(4)} \leq \nu^{(4)}(t) \leq (m_1)^{(4)}, \quad \boxed{\nu^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}}$$

In a completely analogous way, we obtain

$$(\mu_2)^{(4)} \leq u^{(4)}(t) \leq (\mu_1)^{(4)}, \quad \boxed{u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

it follows $(\nu_0)^{(8)} \leq \nu^{(8)}(t) \leq (\nu_1)^{(8)}$

In the same manner , we get 422

$$\nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)} + (\bar{C})^{(8)}(\bar{\nu}_2)^{(8)} e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}}{1 + (\bar{C})^{(8)} e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)} - (\bar{\nu}_2)^{(8)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(8)} = \frac{(\bar{\nu}_1)^{(8)} - (\nu_0)^{(8)}}{(\nu_0)^{(8)} - (\bar{\nu}_2)^{(8)}}}$$

From which we deduce $(\nu_0)^{(8)} \leq \nu^{(8)}(t) \leq (\bar{\nu}_8)^{(8)}$

If $0 < (\nu_1)^{(8)} < (\nu_0)^{(8)} = \frac{G^0_{40}}{G^0_{41}} < (\bar{\nu}_1)^{(8)}$ we find like in the previous case, 423

$$(\nu_1)^{(8)} \leq \frac{(\nu_1)^{(8)}+(C)^{(8)}(\nu_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)}-(\nu_2)^{(8)}\right)t\right]}}{1+(C)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)}-(\nu_2)^{(8)}\right)t\right]}} \leq \nu^{(8)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\bar{\nu}_1)^{(8)}$$

If $0 < (\nu_1)^{(8)} \leq (\bar{\nu}_1)^{(8)} \leq \boxed{(\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0}}$ , we obtain

424

$$(\nu_1)^{(8)} \leq \nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\nu_0)^{(8)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(8)}(t)$ :-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(8)}(t)$ :-

$$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}, \quad \boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

**Particular case :**

If $(a''_{40})^{(8)} = (a''_{41})^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)}G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b''_{40})^{(8)} = (b''_{41})^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then $(u_1)^{(8)} = (\bar{u}_1)^{(8)}$if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)}T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

**Proof** : From 99,20,44,22,23,44 we obtain

$$\frac{d\nu^{(9)}}{dt} = (a_{44})^{(9)} - \left((a'_{44})^{(9)} - (a'_{45})^{(9)} + (a''_{44})^{(9)}(T_{45}, t)\right) - (a''_{45})^{(9)}(T_{45}, t)\nu^{(9)} - (a_{45})^{(9)}\nu^{(9)}$$

**Definition of** $\nu^{(9)}$ :- $\boxed{\nu^{(9)} = \frac{G_{44}}{G_{45}}}$

It follows

$$-\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_2)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right) \leq \frac{d\nu^{(9)}}{dt} \leq -\left((a_{45})^{(9)}\left(\nu^{(9)}\right)^2 + (\sigma_1)^{(9)}\nu^{(9)} - (a_{44})^{(9)}\right)$$

From which one obtains

**Definition of** $(\bar{\nu}_1)^{(9)}, (\nu_0)^{(9)}$ :-

For $0 < \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}} < (\nu_1)^{(9)} < (\bar{\nu}_1)^{(9)}$

$$\nu^{(9)}(t) \geq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}} \quad , \quad \boxed{(C)^{(9)} = \frac{(\nu_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\nu_2)^{(9)}}}$$

it follows $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\nu_9)^{(9)}$

In the same manner , we get

$$\nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(9)} = \frac{(\bar{\nu}_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\bar{\nu}_2)^{(9)}}}$$

From which we deduce $(\nu_0)^{(9)} \leq \nu^{(9)}(t) \leq (\bar{\nu}_1)^{(9)}$

If $0 < (\nu_1)^{(9)} < (\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0} < (\bar{\nu}_1)^{(9)}$ we find like in the previous case,

$$(\nu_1)^{(9)} \leq \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}}{1 + (C)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}} \leq \nu^{(9)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \leq (\bar{\nu}_1)^{(9)} \leq \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}}$ , we obtain

$$(\nu_1)^{(9)} \leq \nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)} e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(9)}(t)$ :-

$$(m_2)^{(9)} \leq \nu^{(9)}(t) \leq (m_1)^{(9)}, \quad \boxed{\nu^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(9)}(t)$ :-

$$(\mu_2)^{(9)} \leq u^{(9)}(t) \leq (\mu_1)^{(9)}, \quad \boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

**Particular case :**

If $(a''_{44})^{(9)} = (a''_{45})^{(9)}, then\ (\sigma_1)^{(9)} = (\sigma_2)^{(9)}$ and in this case $(\nu_1)^{(9)} = (\bar{\nu}_1)^{(9)}$ if in addition $(\nu_0)^{(9)} = (\nu_1)^{(9)}$ then $\nu^{(9)}(t) = (\nu_0)^{(9)}$ and as a consequence $G_{44}(t) = (\nu_0)^{(9)} G_{45}(t)$ **this also defines** $(\nu_0)^{(9)}$ **for the special case** .

Analogously if $(b''_{44})^{(9)} = (b''_{45})^{(9)}, then\ (\tau_1)^{(9)} = (\tau_2)^{(9)}$ and then
$(u_1)^{(9)} = (\bar{u}_1)^{(9)}$if in addition $(u_0)^{(9)} = (u_1)^{(9)}$ then $T_{44}(t) = (u_0)^{(9)} T_{45}(t)$ This is an important consequence of the relation between $(v_1)^{(9)}$ and $(\bar{v}_1)^{(9)}$, **and definition of** $(u_0)^{(9)}$.

## ASYMPTOTIC STABILITY ANALYSIS

**Theorem 8:** If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(8)}$ *and* $(b_i'')^{(8)}$ Belong to $C^{(8)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

**Definition of** $\mathbb{G}_i, \mathbb{T}_i$ :- 580

$$G_i = G_i^* + \mathbb{G}_i \qquad , T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial (a_{41}'')^{(8)}}{\partial T_{41}}(T_{41}^*) = (q_{41})^{(8)} \quad , \frac{\partial (b_i'')^{(8)}}{\partial G_j}\left( (G_{43})^{*} \right) = s_{ij}$$

Then taking into account equations and neglecting the terms of power 2, we obtain

$$\frac{d\mathbb{G}_{40}}{dt} = -\left((a_{40}')^{(8)} + (p_{40})^{(8)}\right)\mathbb{G}_{40} + (a_{40})^{(8)}\mathbb{G}_{41} - (q_{40})^{(8)}G_{40}^*\mathbb{T}_{41} \quad 581$$

(1) The Loschmidt echo is (=) a measure of the revival occurring when (e) an imperfect time-reversal procedure is applied to (e&eb) a complex quantum system.
(2) It allows to quantify the sensitivity of quantum evolution to (e&eb) perturbations.
(3) An initial quantum state $|\psi 0\rangle$ evolves during a time t under (e&eb) a Hamiltonian H1 reaching the state $|\psi t\rangle$.

(4) Aiming to recover the initial state $|\psi 0\rangle$ a new Hamiltonian $-H2$ is applied between (e&eb) t and 2t.
(5) Perfect recover of $|\psi 0\rangle$ would be achieved by (e&eb) choosing H2 to be (=) equal to H1.
(6) This is not possible in realistic setups, and there always appears (eb) a difference between H2 and H1, leading (eb) to a non-perfect recovery of the initial state.
(7) The forward evolution between t and 2t under (e&eb) the Hamiltonian $-H2$ is equivalent to (eb) a backward evolution from t to 0 under H2, which embodies (e) the notion of time-reversal.
(8) The Loschmidt echo studies are focused on the cases where (e) the dynamics induced by the Hamiltonians H1 and H2 are (=) non-trivial, or sufficiently complex (like that of a classically chaotic one-particle system or a many-body system).

**Basic concept Refs. (Loschmidt 1876; Boltzmann 1877)**

(9) The concept of time-reversal has captured the imagination of physicists for centuries, leading to numerous vivid discussions. An emblematic example of these was the controversy around the second law of thermodynamics between Joseph Loschmidt and Ludwig Boltzmann, currently known as the Loschmidt paradox. When Boltzmann was trying to develop the microscopic theory of the second law of thermodynamics, Loschmidt raised an objection that had profound influence on the subsequent development of the theory. He argued that, due to the time-reversal invariance of classical mechanics, evolution in (eb) which the entropy can decrease must exist.
(10) These states could be reached by reversing (e&eb) velocities of all molecules of the system.
(11) After such a reversal the entropy would then no longer grow but decrease, seemingly violating (e) the second law of thermodynamics.
(12) As a response Boltzmann argued that such a time-reversal experiment would be impossible and put forward a statistical interpretation of the second law. Undoubtedly, Boltzmann's argument is a valid approach to the problem of the "arrow of time" for generic macroscopic systems. However, in quantum systems with few degrees of freedom, today's technological advances make it meaningful to address time-reversal experiments.

**Pioneering experiments Refs. (Hahn 1950; Rhim et al. 1971; Brewer et al. 1984; Zhang et al. 1992; Levstein et al. 1998)**

(13) The first controlled experimental implementation of time-reversal was achieved in the fifties with the inversion of nuclear spins precessing around (e&eb) a magnetic field.
(14) Such a reversal was able to compensate (e&eb) the local-field inhomogeneities responsible for (e) the decay of (e) the free induction signal.
(15) The time-reversal was implemented through (e&eb) a radio-frequency pulse, leading to (eb) the formation of a revival in the induction signal, known as (=) spin echo or Hahn echo.
(16) Early on Erwin Hahn recognized that his procedure, which he viewed as a change in the sign of the system Hamiltonian, provided (eb) a quantum implementation of the Loschmidt proposal.
(17) Interactions between spins, not reversed in Hahn's procedure, were the main cause of (e) the decay of the echo, within a time scale known as T2.
(18) This experiment was followed by a number of variants, both within magnetic resonance as well in other time-dependent spectroscopes'. In particular, the dynamical decoupling techniques implemented in quantum registries to isolate them from (e) their environment are (=)variants of Hahn's original experiment.
(19) The next level of complexity was developed with (e&eb) the reversal of the many-body interactions.
(20) No general recipe is available in this case, but the sign of the truncated spin-spin dipolar interaction, which is associated with (e&eb) the cosine of the angle between the inter-spin vector and the

quantizing magnetic field, can be reversed by (e) rotating the spins into a quantization axis. This was the proposal of the magic echo procedure, implemented by Won-Kyu Rhim, Alex Pines and John Stewart Waugh in the seventies.

(21) Substantially simpler is the polarization echo sequence, implemented by Richard Ernst and collaborators in the nineties. In this last case the initial state has (e) a local nature as it is labeled by the presence of a rare 13C which plays (e&eb) the role of a local probe to inject and later on detect the polarization of a nearby 1H immersed in a 1H network.

(22) This idea was further exploited by Patricia Levstein, Horacio Pastawski and Gonzalo Usaj to test the stability of (e) many-body dynamics.

(23) They suggested that the inefficiency of the time-reversal procedure found in all the previous experiments has a connection with (e&eb) quantum chaos and the inherent dynamical complexity of the many-body spin system.

**Definition Refs. (Peres 1984; Jalabert et al. 2001)**

(24) The Loschmidt echo is defined as M(t)=||⟨ψ0|eiH2t/ħe−iH1t/ħ|ψ0⟩||2,(1) where |ψ0⟩ is the state of the system at time 0, H1 is the Hamiltonian governing (e&eb) the forward evolution, H2 is the Hamiltonian governing (e&eb) the backward evolution, t is the instant at which the reversal takes place. Figure 1: Schematic flow of the time-evolution for (a) the Loschmidt echo and (b) the fidelity.

(25) The time evolution appearing in Eq. (1) is schematically represented in Figure 1 (a), where the **Loschmidt echo quantifies (eb) the degree of irreversibility**.

(26) Alternatively, Eq. (1) can be interpreted as the overlap at time t of two states evolved from (e) |ψ0⟩ under the action of (e&eb) the Hamiltonian operators H1 and H2.

(27) In this case the Loschmidt echo is (=) a measure of the sensitivity of quantum evolution to (e&eb) perturbations.

(28) The quantity M (t) interpreted in this manner is illustrated in Figure 1 (b) and is usually referred to as (=) fidelity.

(29) The equivalence between Loschmidt echo and fidelity is displayed in Figure 2 for the example of an initially localized wave-packet in (eb) a Lorentz gas.

(30) The probability density of the evolved state under H1 (H2) is plotted in Figure 2 (b) (c), while Figure 2 (d) presents the state resulting from (e) the combined evolution H1 and then −H2 both for a time t.

(31) The overlap squared between the states (a) and (d) defines (eb) the Loschmidt echo, while (e) the overlap squared between the states (b) and (c) defines (eb) the fidelity.

(32) It is important to remark that even though the probability density distributions in figures (b) and (c) are seemingly identical, the phase randomization due to (e) the difference between the two Hamiltonians leads to (eb) a weak Loschmidt echo.

(33) Figure 2: Wave-packet evolution in a Lorentz gas. (a) Initial state at time t=0 with momentum pointing to the left. (b) State evolved with the Hamiltonian H1 in (eb) the interval (0, t). (c) State evolved with (e&eb) the Hamiltonian H2 in the same time interval. (d) State evolved from that depicted in panel (b) with the −H2 for the time interval (t, 2t). In panels (b) and (c) the classical trajectories corresponding to (e&eb) three initial positions within (eb) the original wave-packet are shown for reference. The square of the overlap between the states (a) and (d), the Loschmidt Echo, is (=) M (t) =0.09, the same (=) as that between the states of panels (b) and (c). Adapted from Ref. (Cucchietti et al. 2002b). Copyright (2002), American Physical Society.

(34) The definition given by Eq. (1) assumes (eb) that the Hamiltonian operators H1 and H2 are (=) independent of time.

(35) A generalization to the case of time dependent Hamiltonians is straightforward. The case of **non-**

Hermitian operators H1 and H2 can also be considered, but in such a case the equivalence between the Loschmidt echo and≠ fidelity would not hold.

**Loschmidt echo and decoherence Refs. (Zurek 2001, 2003; Cucchietti et al. 2003, 2004; Casabone et al. 2010; Bonança 2011)**

(36) In an isolated quantum system the evolution is (=) unitary; initially pure states remain pure.
(37) When the system is connected to (e&eb) the external world the purity of an initial state is generically lost (e) in the course of (e&eb) time evolution.
(38) This ubiquitous process is referred to as (=) decoherence.
(39) The coupling to the environment degrees of freedom, or alternatively the lack of complete knowledge of the system Hamiltonian, (e) typically washes the specific interference properties that would be observed within (eb) a unitary evolution.
(40) Since interference is (=) one of the most important signatures of quantum mechanics, decoherence has both, fundamental and practical interest.
(41) Concerning the former aspect, decoherence has been proposed as (=) a road towards the classical behavior observed in (eb) macroscopic systems.
(42) On the second aspect, it is clear that decoherence represents (eb) a limitation in the implementation of quantum computers or nanoscopic devices based on (e) quantum effects, especially when (e) the number of qubits is scaled up, increasing (eb) the complexity of the system.
(43) The Loschmidt echo, by including (e) a non-controlled part of the Hamiltonian, or the noisy effects of the environmental degrees of freedom, gives a way (eb) to **quantify decoherence effect**.
(44) By attempting the time-reversal of the controlled part of the Hamiltonian, (eb) one can quantify at which rate the neighborhood of the system (either a unitary part of larger system Hamiltonian or though the effect of (e) infinite uncontrolled environmental degrees of freedom) acts as (=) decoherence.
(45) Moreover, other quantifiers of decoherence, such as for instance the purity, can be shown, under certain assumptions, to be characterized by (e) the same dependence on the underlying classical dynamics as the Loschmidt echo.

**Loschmidt echo and fidelity of quantum computing Ref. (Georgeot et al. 2001, 2002; Frahm et al. 2004; García-Mata et al. 2008)**

(46) A realistic quantum computer (see e.g., Nielsen & Chuang 2000) will always operate in (e&eb) presence of noise, decoherence and residual static imperfections and inter-qubit couplings between (e&eb) qubits forming (eb) a quantum computer hardware.
(47) These imperfections affect (e&eb) the accuracy of quantum computations being linked with (e&eb) fidelity decay.
(48) The dependence of fidelity decay for quantum algorithms simulating (e&eb) classical and quantum chaotic dynamics are analyzed in above papers and the universal law for fidelity decay in quantum computations of (e) complex dynamics in (eb) presence of realistic imperfections is established on (e) the basis of analytical theory and extensive numerical simulations with up to 30 qubits.

**Broad interest of the Loschmidt echo**

(49) Since the beginning of this century, the Loschmidt echo has been a subject of intensive studies by researchers from different scientific communities. A list of problems, in which the concept of the Loschmidt echo appears naturally, includes
(i) Quantum chaos, or the quantum theory of classically chaotic systems
(ii) Decoherence or the emergence of "classical world" (open quantum systems)

(iii) Quantum computation and quantum information
(iv) Spin echo in Nuclear Magnetic Resonance
(v) Linear waves (Elastic waves, microwaves, time-reversal mirrors, etc.)
(vi) Nonlinear waves (Bose-Einstein condensates, Loschmidt cooling, etc.)
(vii) Statistical mechanics of small systems
(viii) Quantum chemistry and molecular dynamics
(ix) Quantum phase transitions and quantum criticality

**Mathematical aspects of the Loschmidt echo**

(50) Such broad interest stems from the fact that the Loschmidt echo is (=) a measurable quantity exhibiting (eb), in certain regimes, a robust and universal behavior.
(51) It is by means of the forward and backward time-evolutions that the Loschmidt echo filters out (e&eb) some uninteresting effects, while (e) amplifying other, more important physical processes taking place in complex quantum systems.

**Loschmidt echo: techniques and main results**

(52) The Loschmidt echo is (=) typically a decreasing function of t.
(53) It is therefore of foremost importance to determine (eb) the form of the decay and the associated characteristic times in various physical situations as (=) a function of the characteristic quantities of the problem.
(54) Even though the Loschmidt echo has been addressed in a variety of scenarios, the main effort has been directed towards the simplest set-up of one-body dynamics. Well established results for the case of one-body systems, together with techniques adapted from the field of quantum chaos, are summarized in this section.

**Characteristic quantities**

(55) A number of physical quantities, describing (eb) characteristic time and energy scales of (e) a system under consideration, prove to be (=) especially important in the theoretical studies of the Loschmidt echo. These quantities include:

(i) g, mean density of states -- By definition, $g(E)=1(2\pi\hbar)dV(E)E$, where V(E) is the volume of the phase-space enclosed by (e&eb) a surface of constant energy E.
(ii) The mean level spacing $\Delta$ is given by (=) an inverse of the density of states, $\Delta=1/g$.
(iii) Note that g is the smooth part (or average) of the full density of states, $g_{full}(E) = \sum_n \delta(E-E_n)$, where $\{E_n\}$ are (=) the eigenenergies of the Hamiltonian.
(iv) glocal, local density of states. -- Let $|\psi\rangle$ be a reference quantum state. The local density of states with respect to $|\psi\rangle$ is defined as (=) $g_{local}(E,|\psi\rangle)=\sum_n |\langle n|\psi\rangle|^2\delta(E-E_n)$, where $\{|n\rangle\}$ and $\{E_n\}$ are respectively the **eigenstates and eigenenergies** of the Hamiltonian in question.
(v) N, effective size of the Hilbert space for a quantum state. -- An initial quantum state $|\psi 0\rangle$ of a closed quantum system can be viewed as (=) a linear combination of N eigenstates of the Hamiltonian.
(vi) In a d-dimensional system, N is given by (=) the volume of the phase space, accessible to (e) $|\psi 0\rangle$ in the course of its time evolution, divided by/ the volume of the Planck's cell, $(2\pi\hbar)$ d.
(vii) $\lambda$, mean **Lyapunov exponent**. -- In classical systems with chaotic dynamics, a distance between (e&eb) two typical trajectories, initiating at (eb) infinitesimally close points in (eb) phase-space, grows (eb) exponentially with time.
(viii) The rate of this growth, averaged over (e&eb) all trajectory pairs at a given energy, is (=) the

mean Lyapunov exponent λ.

(ix) The latter characterizes (eb) dynamical instability of a classical system with respect to (e&eb) perturbations of its initial conditions.

(x) tE, Ehrenfest time. -- The center of an initially localized wave packet stays close to (e) the phase-space trajectory of (e) the corresponding classical particle for (e) times shorter than the so-called Ehrenfest time, tE.

(xi) The latter, in chaotic systems, can be estimated as (=) tE=1λlnLσ, where λ is (=) the mean Lyapunov exponent of the classical system, L is (=) the characteristic linear size of the system, and σ is (=) the initial dispersion of the wave packet.

(xii) **tH, Heisenberg time**. -- The discreteness of the energy spectrum of a closed quantum system becomes dynamically important at times comparable to (e&eb) (and longer than) the so-called Heisenberg time, tH=ħ/Δ=ħg, where (e) Δ and g are the mean energy level spacing and the mean density of states, respectively. Semiclassical (short-wavelength) approximations to quantum dynamics are known to break down beyond (e) the Heisenberg time.

**Calculational techniques Semi classics Refs. (Jalabert 2001; Vanícek et al. 2003; Cucchietti et al. 2004; Vanícek 2004, 2006; Gutkin et al. 2010; Zambrano et al. 2011)**

(56) In this context, semi classics stand for (=) the short-wavelength approximation to the quantum evolution in terms of (e&eb) classical trajectories.

(57) The key ingredient is the **Van Vleck-Gutzwiller approximation** to (e) the propagator (matrix element of the evolution operator in (eb) the position representation) ⟨q′|e−iHt/ħ|q⟩=(12πiħ)d/2∑γ(q→q′,t)C1/2γexp(iħRγ−iπ2νγ)(2)

(i) γ stands for the classical trajectories going from q to q′ in time t.

(ii) Rγ=∫t0dτLγ is the Hamilton's principal function for the trajectory γ.

(iii) Here, Lγ denotes the Lagrangian along γ.

(iv) Cγ=|det(−∇q′∇qRγ)| is the stability factor of γ

(v) νγ is the number of conjugate points along γ

(vi) d is the number of dimensions of the position space.

Figure 3: Semiclassical approximation to the Loschmidt echo.

(58) A combination of Eqs. (1) and (2) leads to the semiclassical approximation to the Loschmidt echo shown in Figure 3. Here, the summand is a product of terms with the following pictorial representation:

(59) A red circles at a point qj corresponds to (e&eb) ⟨qj|ψ⟩

(60) A blue circles at a point qj correspond to ⟨ψ|qj⟩.

(61) That is, every blue circle is a complex conjugate of the corresponding red circle

(62) A solid curve leading from qj to qk along a trajectory γ corresponds to (2πiħ)−d/2 C1/2γexp(iRγ/ħ−iπνγ/2). The Hamiltonian H1 is used if γ equals α1, and the Hamiltonian H2 is used if γ equals β2.

(63) A dashed curve leading from qj to qk along a trajectory γ corresponds to (e&eb) (−2πiħ)−d/2 C1/2γexp(−iRγ/ħ+iπνγ/2)

(64) The Hamiltonian H1 is used if γ equals (=) α2 and the Hamiltonian H2 is used if (e) γ equals β1. In other words, every dashed curve is a complex conjugate of the corresponding solid curve.

(65) In Loschmidt echo studies one is typically in interested in the case of H2 being close to H1.

(66) It is common to describe the perturbation by an operator defined as κΣ=H2−H1,(3) where κ parametrizes its strength.

(67) The expression in Figure 1 is, in general, extremely complicated to calculate as it involves six

spacial integrals and the sum over four classical trajectories. Semiclassical evaluations of the Loschmidt echo deal with different approximations to the expression in Figure 1. The following steps are usually implemented in the semiclassical calculations in order to obtain meaningful analytical results:

(a) If the initial state is spatially localized around a point q0, the diagram of Figure 1 can be approximated by a simpler diagram in which the points q1, q2, q3, and q4 merge into (e&eb) q0. Within this approximation there are only two spacial integrals to be done (over q5, and q6).

(b) Assuming that the perturbation $\kappa\Sigma$ is classically small but quantum mechanically significant (which means that the perturbation does not (e) change the topology of the trajectories but introduces a phase difference) trajectories $\alpha$ j and $\beta$j are identified for j=1, 2.

(c) This is the so-called diagonal approximation. The shadowing theorem ensures (eb) that the identification of classical trajectories $\alpha$ and $\beta$ is always possible and that the resulting action difference can be obtained from (e) the accumulated phase of the perturbation along one of the trajectories.

(d) For instance, in the case where $\Sigma$ only depends on position coordinates $\Delta R\gamma=-\kappa\int t0 d\tau\ \Sigma\ (q\gamma\ (\tau))$, (4) for $\gamma=\alpha1, \alpha2$. The diagonal approximation reduces the expression in Figure 1 to (e&eb) a sum over only two trajectories, $\alpha1$ and $\alpha2$, of the unperturbed system.

(e) A key step that allows to make further progress in the semiclassical calculation is (=) to regroup the resulting pair of trajectories ($\alpha1$,$\alpha2$) into two different families:

(i) Trajectories where q5 is near q6 and $\alpha1$ evolves close to (e) $\alpha2$.

(j) The rest of pairs, where (e) the two trajectories are uncorrelated

(k) The semiclassical calculation usually proceeds by estimating the accumulated phases along (e&eb) the trajectories for (e) the two kinds of resulting pairs, and then performing some kind of average of M(t) (over the perturbation, the initial conditions or the evolution of the classical trajectories).

(l) In the case of complex classical dynamics these averages are justified and allow (eb) to obtain the mean value $\overline{M(t)}$ of the Loschmidt echo in terms of (e&eb) the main parameters of problem.

(68) An alternative semiclassical formulation for fidelity amplitude m(t) (defined through $M(t)=|m(t)|2$) which avoids (e) the usual trajectory-search problem of the standard semi classics, is (=) the so called dephasing representation $m(t)=\int dqdp\exp(-i\hbar\Delta R(q,p,t))W0(q,p)(5)$ where $W0(q,p)=1(2\pi\hbar)d\int d(\delta q)\exp(-i\hbar p\cdot\delta q)\langle q+\delta q2|\psi0\rangle\langle\psi0|q-\delta q2\rangle(6)$ is (=) the **Wigner function** of the initial state $|\psi0\rangle$ and $\Delta R(q,p,t)=\int t0 d\tau[L2(\bar{q}(\tau),\bar{p}(\tau))-L1(\bar{q}(\tau),\bar{p}(\tau))](7)$is (=) the action difference evaluated along (e&eb) the phase-space trajectory $(\bar{q}(\tau),\bar{p}(\tau))$ evolved from (q,p) under (e&eb) the unperturbed Hamiltonian H1.

(69) In this way the decay can be attributed to the dephasing produced by (e) the perturbation of the actions --thus the name dephasing representation.

(70) In the case where $\Sigma$ only depends on position coordinates (as in Eq. (4)) the phase difference (7) reads $\Delta R\ (q, p, t) =-\kappa\int t0 d\tau\ \Sigma\ (\bar{q}\ (\tau))$. (8)

(71) For generic chaotic systems and initially localized states, the calculation of M (t) using the dephasing representation follows (e&eb) the same lines of the standard semi classics.

(72) The standard semiclassical approach becomes (=) an initial-value problem once the integration over the final position is traded by (e&eb) the integration over the initial momentum using (e) the stability factor C$\gamma$ as the Jacobian of the transformation.

(73) However, Eq. (5) bears the advantage that it regards m (t) as the solution of an initial-value problem, as opposed to (e&eb) a boundary-value problem.

(74) This proves especially convenient in situations when (e) the sums over classical trajectories are evaluated explicitly.

**Random matrix theory Refs. (Cucchietti et al. 2002a; Cerruti et al. 2003; Frahm et al. 2004; Gorin et al. 2004; Stöckmann et al. 2004, 2005; Kohler et al. 2008, 2011, 2012)**

(75) Random matrix theory is a powerful technique to understand the statistical behavior of (e) quantum complex systems.

(76) Among the latter quantum systems exhibiting (eb) chaotic dynamics in the classical limit are particularly important, as their spectral properties are well described by (e) averages taken over appropriate ensembles of (e) matrices that satisfy certain general symmetry restrictions.

(77) The simplest Hamiltonian ensemble is (=) that of real symmetric N×N matrices (appropriate for cases with time-reversal symmetries) usually referred to as Gaussian Orthogonal Ensemble.

(78) The invariance of the probability distribution under (e&eb) orthogonal transformations and the statistical independence of the matrix elements lead to (eb) a joint probability distribution of the matrix elements of the Hamiltonian, PN(H)=KNexp(−tr{H2}4v),(9) where (e) v defines the scale of the matrix elements and KN is a normalization constant. Each of the N (N+1)/2 independent matrix element Hij is (=) a zero-centered Gaussian such that Hij¯¯¯¯¯=H2ij¯¯¯¯¯=0(1+δij) v2i≤j,i≤j.

(79) The averages are taken over (e&eb) the matrix ensemble.

(80) The Loschmidt echo in complex systems can be addressed by imposing (e&eb) the Random Matrix hypothesis for (e) the forward evolution Hamiltonian H1, for (e) the perturbation κΣ representing (eb) the imperfection of the time-reversal, or for both.

(81) Generically, the same results are obtained, independently of (e) the choice of the matrix considered to be random.

(82) Averages of the Loschmidt echo over matrix ensembles are justified for (e) ergodic classical dynamics.

(83) The absence of finite classical time scales, like the inverse Lyapunov exponent or the escape rate, in the Random matrix theory hinders (e) the description of the Loschmidt echo decays that depend on ∝ those quantities.

(84) Recently, using the Random-Matrix-Theory approach, Kohler and coworkers have established relations between the averaged fidelity decay and (e&eb) the so-called cross-form factor, characterizing (eb) parametric correlations of the energy spectra of (e) the unperturbed and perturbed systems.

(85) Notably, these relations exist not only in the case of (e) fully chaotic unperturbed and perturbed systems, but also in (eb) the case of a regular system perturbed by (e) a chaotic perturbation. General dependence of the fidelity decay on (=) Heisenberg and Thouless time scales is established by Frahm et al.

**Numerical simulations Refs. (Tal-Ezer et al. 1984; De Raedt 1996; van Dijk et al. 2011)**

(86) A numerical simulation of (e) the time-evolution of initially localized wave-packets under slightly different Hamiltonians, H1 and H2, is (=) a valuable tool in understanding the behavior of the Loschmidt echo in (eb) different systems and various regimes.

(87) Even though there exist numerous approaches to solving the **time-dependent Schrödinger equation** on a computer, the majority of numerical studies of the Loschmidt echo have been concerned with (e&eb) the following two methods. Both methods provide accurate, efficient, and stable approximations to (e) the evolution operator e−iAτ, where (e) the operator A corresponds to (e&eb) a (properly rescaled) Hamiltonian, and τ denotes (eb) a sufficiently short propagation time-step.

(88) **Trotter-Suzuki algorithm**. -- This method involves three implementation stages. First, one decomposes A into (e&eb) a finite (and practically small) number of components, A=A1+A2+…+An, such that (e) the operator exp (−iAjt) can be constructed analytically for (e) all

j=1, 2… n.

(89) Second, one defines (eb) the symmetric operator U2 (τ) =e−iAnτ/2…e−iA2τ/2e−iA1τe−iA2τ/2…e−iAnτ/2.

(90) Third, one constructs the operator U4(τ)=U2(pτ)U2(pτ)U2((1−4p)τ)U2(pτ)U2(pτ) with (e&eb) p=1/(4−41/3).

(91) This provides a unitary approximation to (e) the original propagator accurate up to (e) the 4th order in τ, i.e., e−iAτ=U4 (τ) +O (τ5).

(92) **Chebyshev-polynomial expansion**. -- This approach requires (e) that the operator A is (=) normalized in such a way that all its eigenvalues lie (eb) in the interval between -1 and 1.

(93) The method involves constructing the operator SN(τ)=J0(τ)+2∑Nn=1(−i)nJn(τ)Tn(A), where (e) {Jn} and {Tn} are, respectively, the **Bessel functions** of the first kind and the Chebyshev polynomials of the first kind.

(94) In actual computations, one makes use of the recurrence relation Tn+1(A)=2ATn(A)−Tn−1(A), with (e&eb) T0(A)=1 and T1(A)=A, to calculate (eb) SN(τ).

(95) Then, for large values of n and fixed τ, the Bessel function Jn (τ) rapidly decays as (e) a function of n.

(96) In fact, |Jn (τ)|∼(τ/2)n/n! as (e) n→∞.

(97) This is why SN (τ), with (e&eb) a sufficiently large N, provides (eb) an extremely accurate approximation to (e) the propagator in question, i.e., e−iAτ=SN (τ) +O ((τ/2) N/N!).

**Decay of the Loschmidt echo: different regimes**

(98) The decay of the Loschmidt echo mainly depends upon ∝ the underlying classical dynamics of the system, the initial state, and the nature and strength of the perturbation κΣ.

(99) The behavior of the Loschmidt echo is fairly well understood for (e) single-particle quantum systems whose dynamics is (=) fully chaotic in the classical limit. Some progress has been done towards the theory of the Loschmidt echo in systems with regular and mixed phase space.

**Chaotic dynamics Refs. (Shepelyansky 1983; Jalabert et al. 2001; Jacquod et al. 2001; Cerruti et al. 2002, 2003; Wisniacki 2002, 2003; Cucchietti et al. 2004; Gorin et al. 2004; Gutiérrez et al. 2009)**

(100) Figure 4: Decay regimes of the Loschmidt echo in quantum systems with (e&eb) chaotic classical limit.

(101) Characteristic crossover times are (=) t≃ħ/η, signaling (eb) the end of the initial parabolic decay, and ts (≃Γ−1lnN for (e) the non-perturbative/exponential regime) indicating (eb) the onset of the saturation.

(102) For classical chaotic dynamics the errors grow exponentially with (e&eb) time and thus the time reversibility of Loschmidt echo is completely broken (e) after logarithmically short times.

(103) This resolves (e) the Loschmidt paradox in the world of classical mechanics.

(104) For a quantum evolution, even if its corresponding classical dynamics is fully chaotic, small errors grow (eb) only polynomially with time in agreement with (e&eb) the quantum perturbation theory and hence a deeper analysis should be performed here.

(105) The time-decay of the Loschmidt echo, averaged over (e&eb) an ensemble of initial states, Hamilton operators, or perturbations, typically exhibits (eb) three consecutive stages (see Figure 4):

(106) **Short-time parabolic decay**: M (t) $\overline{\phantom{xx}}$ ≃1− (ηt/ħ) 2.

(107) It is a short, initial stage of the Loschmidt echo decays in (eb) all quantum systems.

(108) Here, η is (=) an average dispersion of the perturbation operator evaluated with respect to (e&eb) the initial state, i.e., (η/κ) 2=⟨ψ|Σ2|ψ⟩ $\overline{\phantom{xxxx}}$ −⟨ψ|Σ|ψ⟩2 $\overline{\phantom{xxxx}}$.

(109) The parabolic decay holds for (e) times t short enough for (e) the propagators of (e) the

unperturbed and (e&eb) perturbed systems, exp (−iHjt/ħ) with j=1, 2, to be reliably approximated by (e) their second order Taylor expansions, 1−iHjt/ħ− (Hjt) 2/(2ħ2).

(110) **Intermediate-time asymptotic decay:** The short-time parabolic decay is typically followed by (e) an "asymptotic" decay regime, whose functional form depends on ∝ the strength of the perturbation.

(111) **Perturbative/Gaussian regime**, M (t) ¯¯¯

trajectories, while the second term is (=) a contribution of correlated trajectory pairs, such that (e) α1 evolves close to α2 (see section Semi classics).

(125) Unlike the constant c, the prefactor b generally exhibits (eb) an explicit dependence on both t and κ.

(126) However, this dependence is (=) sub-exponential, and, as a consequence, (eb) the decay rate Γ of the Loschmidt echo is dominated by (e) the minimum of cκ2 and λ, leading to (eb) a commonly accepted (but oversimplified) interpretation of (e) the exponential decay (see Figure 6).

(127) For perturbation strengths κ that are weak compared to (e&eb) a critical strength κc, the dependence is (=) parabolic, Γ=cκ2.

(128) The semiclassical calculations give the expression of c in terms of (e&eb) correlation functions of the perturbation, and the random matrix approach leads to (eb) the general dependence cκ2=2πη2/(ħΔ), where η is (=) given by the mean value of the width of the local density of states with respect to (e&eb) the initial state |ψ0⟩.

(129) Such a behavior is commonly referred to as (=) the Fermi-golden-rule regime.

(130) For perturbations that are stronger than κc, but weaker than a certain bound value κb, the decay rate Γ is (=) independent of κ and equals (eb) the average Lyapunov exponent λ of the underlying classical system.

(131) This decay is known as (=) the perturbation-independent or Lyapunov regime.

(132) This regime holds for (e) perturbations up to the breakdown strength κb, beyond (e) which it is no longer possible to regard every trajectory of the perturbed system as a result of (e) a continuous deformation of (e) the corresponding unperturbed trajectory, so that bifurcations have to be (=) taken into account.

(133) The Lyapunov regime is especially remarkable, as the decay rate is (=) totally independent of (e) the strength of the perturbation which is (=) at the origin of the decay.

(134) The exponential decay of the Loschmidt echo is generally followed in time by (e) saturation at a value on the order of N−1, where (e) N is the size of the effective Hilbert space.

(135) This implies that (eb) in the non-perturbative regime, the saturation occurs (eb) at time ts≃Γ−1lnN.

(136) In the case of a two-dimensional chaotic billiard (introduced above), the saturation time is (=) given by ts≃Γ−1ln (|p0|A/ (ħσ)) − (2Γ) −1ln (2π).

(137) It is interesting to note that the saturation time can, in principle, be (=) arbitrarily long.

(138) In particular, ts can exceed other important time scales of quantum dynamics, such as the Heisenberg time tH≡ħg(E) with g(E) denoting the density of states. Indeed, in two-dimensional billiards the saturation time ts→∞ as |p0|→∞, while (e) the Heisenberg time tH is independent of the particle's momentum.

(139) The exponential decay, M (t) ¯¯¯¯¯¯¯¯¯¯≃exp (−Γt), only holds for (e) perturbations weaker than κb.

(140) Beyond this threshold, the exponential regime breaks down and gives (e&eb) way to another regime, in which the Loschmidt echo exhibits (eb) a Gaussian dependence on time.

(141) Some of the mentioned regimes can be obtained using alternative approaches relating the Loschmidt echo with (e&eb) the two-point time auto-correlation function of the generator of the perturbation.

**Local perturbations Refs. (Goussev et al. 2007, 2008; Höhmann et al. 2008; Ares et al. 2009; Köber et al. 2011)**

(142) A Hamiltonian perturbation is said to be "local" if (e) it is concentrated in a small region of (e) the phase space accessible to the system.

(143) In the case of chaotic dynamics, the phase space extent of a local perturbation can be characterized by (e) a rate γ, known as the escape rate, which is defined as (=) the rate at which trajectories of the corresponding classical system visit (e&eb) the perturbation region.

(144) For local perturbations, the escape rate is small compared to (e&eb) the characteristic rate at which a typical trajectory "explores" (e&eb) the dynamically available phase space, and also small compared to (e&eb) the average Lyapunov exponent of the system.

Figure 7: Exponential decay rate Γ as a function of the perturbation strength κ in the case of a local Hamiltonian perturbation.

(145) Figure 7 illustrates the characteristic dependence of the decay rate Γ on the perturbation strength κ. The function Γ (κ) exhibits (eb) a number of distinctive features.

(146) Thus, for sufficiently weak perturbations, the decay rate grows quadratically with (e&eb) the perturbations strength, Γ∼κ2, demonstrating (eb) the Fermi-golden-rule regime.

(147) In the limit of strong perturbations, κ→∞, the decay rate Γ saturates at (eb) a perturbation-independent value 2γ.

(148) This saturation is known as (=) the escape-rate regime.

(149) The crossover from the Fermi-golden-rule to (e&eb) the escape rate regime is (=) non-monotonic, and Γ (κ) generally exhibits (eb) well-pronounced oscillations.

(150) The amplitude and frequency of these oscillations depend on ∝ the nature and physical properties of (e) the particular Hamiltonian perturbation.

(151) An important point is that the function Γ (κ) is given for (e) all strengths κ by the width of (e) the local density of states.

(152) The exponential decay, M (t) $\overline{\qquad}$≃exp (−Γt) with (e&eb) the non-monotonic function Γ (κ) described above and illustrated in Figure 7, has been obtained by (e) semiclassical analysis. (Its existence has now been observed in (eb) numerical and laboratory experiments).

(153) The key assumption of any semiclassical reasoning is (=) that the de Broglie wavelength corresponds to (e&eb) the shortest length scale of the system.

(154) This assumption is obviously violated for (e) systems, in which the spatial linear size of the Hamiltonian perturbation is small, compared to (e&eb) the de Broglie wavelength.

(155) Generally, the decay of the Loschmidt echo in such systems is different from (e) the exponential decay.

(156) For instance, two-dimensional chaotic systems in (eb) the limit of point-like Hamiltonian perturbations, for (e) which γ→0, exhibit (eb) the algebraic, inverse-quadratic decay of (e) the Loschmidt echo, M (t) $\overline{\qquad}$∼t−2.

**Regular and mixed dynamics Refs. (Prosen 2002; Jacquod et al. 2003; Prosen et al. 2003; Sankaranarayanan et al. 2003; Weinstein et al. 2005; Wang et al. 2007; Goussev 2011)**

(157) Time dependence of the Loschmidt echo in quantum system with (e&eb) regular or mixed classical dynamics is typically more complex than (e) that in fully chaotic systems.

(158) As a result of this complexity, a comprehensive classification of decay regimes is still lacking. Nevertheless, a number of important results have been established for the Loschmidt echo decay in systems whose phase space is (eb) predominantly regular in the classical limit.

(159) In the limit of weak Hamiltonian perturbations, κ→0, the average Loschmidt echo generally exhibits (eb) a Gaussian decay.

(160) The duration tG of this decay is inversely proportional to ∝ the perturbation strength, tG∼κ−1.

(161) The existence of the Gaussian decay requires (e) the perturbation to be sufficiently weak

such that (e) the decay time tG is long in comparison with (e&eb) any relaxation (averaging) time scale of the system.

(162) If the Hamiltonian perturbation is sufficiently strong and varies (e&eb) rapidly (or is almost "random") along (e&eb) a typical classical trajectory of (e) the unperturbed Hamiltonian, then (eb) the average Loschmidt echo is known to exhibit (eb) the algebraic decay $\overline{M(t)}\sim t^{-3d/2}$, with d being the dimensionality of the system.

(163) This power-law decay is faster than (e) the decay of the overlap of the corresponding classical phase-space densities, $t^{-d}$.

(164) Numerous case studies of the unaveraged (individual-realization) Loschmidt echo M (t) have revealed that (eb) the functional form of the decay depends strongly upon ∝ the location of the initial quantum state with respect to (e&eb) the phase space of the underlying, unperturbed and perturbed, classical systems.

(165) In addition, the decay is sensitive to (e&eb) certain properties of the Hamiltonian perturbation.

(166) For instance, the Loschmidt echo decays differently depending on ∝ whether the perturbation is global or local in phase space, whether it vanishes under (e&eb) averaging over time, or whether it preserves or destroys (e&eb) integrability of the underlying classical system.

(167) A number of different regimes, such as the exponential decay and power-law decay with vary (e&eb) decay exponents have been observed in (eb) numerical simulations.

(168) Interesting phenomena of quantum revivals, closely related to (e&eb) (quasi-)periodicity of the underlying (e&eb) classical motion, and temporary quantum freeze of (e) the Loschmidt echo have been reported in various studies.

(169) However, a comprehensive classification of all decay regimes of (e) the Loschmidt echo in regular systems still remains a challenge in the field. Model attempts to alleviate the complexity.

**Numerical observation of various decay regimes Refs. (Jacquod et al. 2001; Cucchietti et al. 2002a, 2002b, 2004; Goussev et al. 2007, 2008; Ares et al. 2009; García-Mata et al. 2011b)**

(176) Numerical simulations have been of foremost importance for establishing the results summarized in sections Chaotic dynamics and Regular and mixed dynamics. The main body of numerical work has been devoted to one-particle systems. Various chaotic dynamical systems, globally perturbed, have been studied numerically; among them the Lorentz gas, two-dimensional hard-wall and soft-wall billiards. As a prominent example, Figure 8 shows the crossover from (e) the perturbative Fermi-golden-rule regime to (e&eb) the Lyapunov regime of the decay rate of the

Loschmidt echo as (=) a function of the perturbation strength in the Lorentz gas.

(177) The predictions for local perturbations, described in section Local perturbations, were also tested in (eb) a chaotic billiard system. In this case, a deformation of a small region of (e) the boundary was considered as (=) the perturbation (see Figure 9).

(179) The symbols correspond to (e&eb) the following fraction of the phase space that is perturbed: ▽ (40%), ∆ (30%), + (20%) and ∗ (10%).

(180) The width η of the local density of states is also plotted with solid lines. This width gives (=) the **spread of the states** of the unperturbed system in the bases of (e) the perturbed one

(181) It is noticeable that, the smaller is the perturbed region,(eb) the more similar to η Γ is. Adapted from Ref. (Ares at al. 2009). Copyright (2009), American Physical Society.

(182) Other enlightening numerical studies were carried in quantum maps. These systems possess (e) all the essential ingredients of the chaotic dynamics and are, at the same time, extremely simple from a numerical point of view, both at the classical and at the quantum levels.

(183) The predictions for locally perturbed chaotic systems were (=) also observed in the paradigmatic cat map.

(184) Figure 10 shows the decay rate of the Loschmidt echo as (=) a function of the perturbation strength κ in the cat maps under (e&eb) the action of a local perturbation.

(185) When the map was perturbed in all its phase space, three decay regimes (instead of two) were observed depending on ∝ the perturbation strength: (i) the Fermi-golden-rule regime for (e) weak perturbations, (ii) a regime of an oscillatory dependence of (e) the decay rate on κ at intermediate perturbation strengths, and (iii) the Lyapunov regime for (e) strong perturbations. The complete understanding of the crossover between (e&eb) the last two regimes remains an open problem.

**Beyond the "standard" picture: fluctuations, disorder, many-body systems Refs. (Adamov et al. 2003; Silvestrov et al. 2003; Petitjean et al. 2005; Manfredi et al. 2006, 2008; Quan et al. 2006; Pozzo et al. 2007; Zangara et al. 2012)**

(186) Decay regimes of the average Loschmidt echo, discussed above, are the ones most commonly observed, and generally regarded as (=) "standard", in (eb) low-dimensional quantum systems.

(187) However, when analyzing the Loschmidt echo beyond (e) a simple averaging over the initial state or perturbation, or in a more complex setup, one often encounters (e&eb) departures from (e) the standard picture.

(188) It was fist pointed out by Silvestrov and coworkers that, for sufficiently strong perturbations and on time scales short compared to the Ehrenfest time, statistical fluctuations generally play an important role (e&eb) in the problem of the Loschmidt echo decay.

(189) In particular, the average Loschmidt echo, M (t) ¯¯¯¯¯¯¯¯, is typically dominated by (e) rare fluctuations, characteristic of (e) only a small fraction of the chaotic phase space.

(190) In the main part of the phase space, however, the unaveraged Loschmidt echo, M(t), decays much faster than (e&eb) M(t)¯¯¯¯¯¯¯¯: this decay can be as (=) fast as double-exponential, M(t)∼exp(−constant×e2λt).

(191) It is only after the Ehrenfest time that M (t) follows M (t) ¯¯¯¯¯¯¯¯ in the main part of the phase space.

(192) The variance of the Loschmidt echo, M2¯¯¯¯¯¯¯−M¯¯¯¯2, was addressed by Petitjean and Jacquod within (e&eb) both a semiclassical and a Random Matrix Theory approach.

(193) The variance was shown to exhibit (eb) a rich nonmonotonous dependence on time, characterized by (e) an algebraic growth at short times followed by (e&eb) an exponential decay at long times.

(194) In disordered systems, the Loschmidt echo may exhibit (eb) even richer decay than that in low-dimensional dynamical systems, since (e) the elastic mean-free path and the disorder correlation length enter (e&eb) as relevant scales.

(195) For long-range disorder (small-angle scattering) an asymptotic regime governed by (e&eb) the classical Lyapunov exponent emerges.

(196) A Josephson flux qubit operated at high energies leads to (eb) a chaotic dynamics, and the Lyapunov regime can be obtained when (e) a Loschmidt setup is considered in such a system.

(197) The Loschmidt echo studies in (eb) many-body systems are comparatively less developed than those in one-body cases. Model throws light on the issue

(198) The numerical calculation of the many-body Loschmidt echo is a highly demanding computational task, and the standard approximations are in difficulty for (e) describing the small difference obtained after (e) the forward and backward time-evolutions.

(199) For this reason, the most reliable results of Loschmidt echo in many-body systems are (=) those of a one dimensional spin chain or in an Ising model with transverse field, where (e) the influence of criticality in the fidelity decay has been established.

(200) Trapped Bose-Einstein condensates have been treated as (=) a many-body Loschmidt echo setup using (e) mean-field approaches.

**Phase-space representation and classical fidelity Refs. (Benenti et al. 2002, 2003; Eckhardt 2003; García-Mata et al. 2003; Cucchietti et al. 2004; Veble et al. 2004)**

(201) An intuitively appealing representation of the **Loschmidt echo in phase space** is obtained by (e) expressing Eq. (1) as $M(t)=1(2\pi\hbar)d\int dq\int dp\ WH1(q,p;t)\ WH2(q,p;t)(11)$ where (e) WH1 and WH2 are the Wigner functions resulting from (e) the evolution of W0(q,p), introduced in Eq. (6), under (e&eb) the action of the Hamiltonian operators H1 and H2 respectively.

(202) This approach is naturally connected to (e&eb) the dephasing representation of section Semi classics and provides (eb) a particularly useful framework in the study of decoherence, as the Wigner function is a privileged tool to (e) understand the connection between quantum and (e&eb) classical dynamics.

(203) An initial Gaussian wave-packet is associated with (e&eb) a Gaussian Wigner function that will develop (eb) in phase-space non-positive structures and be deformed under (e&eb) the evolution of H1 and H2.

(204) The sensitivity of the overlap (11) to the non-positive parts and (e&eb) to the deformations of the Wigner function can be related with (e&eb) the different decay regimes discussed in section Chaotic dynamics.

(205) The form (11) of the quantum fidelity allows (eb) to define a classical fidelity by using in (e&eb) a classical problem the **Liouville distributions** LH1 and LH2 instead of (e&eb) WH1 and WH2 respectively.

(206) This definition follows from the logical representation of the Liouville distribution as (=) the classical limit of the Wigner function.

(207) However, the definition by an overlap of distributions does not (e) convey the sense of classical reversibility: a trajectory evolving forward in time with H1 and backwards with H2 would give a considerable contribution to (e&eb) the overlap not only if it ends up close to the initial point, but whenever (e) the final point is in the neighborhood of those of the initial distribution.

(208) The labeling of trajectories and particles, characteristic of classical mechanics, is (=) then not taken into account in this definition of classical fidelity.

(209) The correspondence principle dictates that (e&eb) the quantum fidelity follows its (e&eb) classical counterpart up to (e) the Ehrenfest time.

(210) However, such a correspondence does not imply that, in the intermediate-time asymptotic decay of globally perturbed chaotic systems, the Lyapunov regime is only present up to this characteristic time scale.

(211) In fact, the Lyapunov regime is not simply an effect of the classical-quantum correspondence. For instance, in a two-dimensional billiard, the saturation time tS (see section Chaotic dynamics) that would signal the end of the asymptotic decay (and so the end of the Lyapunov decay if one is in the appropriate regime) can be much larger than the Ehrenfest time.

**Experiments Nuclear Magnetic Resonance Ref. (Slichter 1990). See particularly Sec. 8.8 and App. E.**

(212) Nuclear magnetic resonance has been the main tool to study echoes generated by different time-reversal procedures since the fifties.

(213) After the time-reversal of individual spin precession implemented by Erwin Hahn in the spin echo, one had to wait until the seventies, when Rhim and Kessemeir achieved (eb) the reversion of (e) the spin-spin interactions.

(214) The resulting reversal of the macroscopic polarization is known as (=) magic echo and was thoroughly studied by Rhim, Pines and Waugh. In the nineties Ernst et al. implemented a strategy to address a localized spin excitation and Levstein et al. realized that such study was (=) optimal for a theoretical description.

(215) They used crystal structures with abundant of interacting 1H spins, where (e) the dipolar coupling produces (eb) the "diffusion" of the initial polarization.

(216) The time-reversal procedure is then able to refocus the excitation generating (eb) a polarization echo. These last experiments have a direct connection with the concepts discussed in this review.

**Basic concepts on spin dynamics Refs. (Pastawski et al. 1995; Mádi et al. 1997; Levstein et al. 1998; Danieli et al. 2004; Zangara et al. 2012)**

(217) A typical experiment starts with a sample which constitutes a network with about 1023 interacting spins in (eb) thermal equilibrium in (eb) presence of an external magnetic field B0.

(218) This many-spin state is denoted as (=) $|\Psi eq\rangle$.

(219) In this state every spin has an almost equal probability of being up or down since (e) the thermal energy, kBT is much higher than (e) any other relevant energy scale of the system.

(220) At time t=0 a sequence of radiofrequency pulses ensures (eb) that spin at site 0th is oriented along (e&eb) z direction.

(221) This is represented by the action of the spin operator S+0 on (e&eb) $|\psi eq\rangle$.

In a system with m+1 spins, we represent this initially excited state as (=) $|\Psi 0\rangle=S+0|\Psi eq\rangle||\langle\Psi eq|S-0S+0||\Psi eq\rangle||1/2=\sum r=12mei\phi r2m/2|\uparrow 0\rangle\otimes|\beta r\rangle$,(12) where (e) the denominator $||\langle\Psi eq|S-0S+0||\Psi eq\rangle||1/2$ ensures (eb) that the initially excited state has (e) a proper normalization and $\phi r$ is (=) a random phase that describe (eb) a mixture of states of the form (eb) $|\beta r\rangle=|s1\rangle\otimes|s2\rangle\otimes|s3\rangle\otimes...\otimes|sm\rangle$with$|sk\rangle\in\{|\uparrow\rangle,|\downarrow\rangle\}$.(13

(223) The preparation of this state involves the use of (e &eb) a 13C nucleus as a "spy" to inject and detect (e&eb) polarization at the directly bonded 1H spin (0th).

(224) Then, the system evolves under (e&eb) mutual many-body interaction described by (e) H1 for a period t1.

(225) In the polarization echo experiment, this is described by effective dipolar interaction Hamiltonian H1, truncated by (e) the Zeeman field,

H1≡PolarizationEchoExperiment∑i,j[2SziSzj−12(S+iS−j+S−iS+j)].(14)

(226) H1 contains (e) flip-flop or XY operators of (e) the form S+iS−j+S−iS+j, as well as Ising terms of the form SziSzj.

(227) The dipolar interaction di, j constant decay with (e&eb) the third power of the distance between sites i and j.

(228) H1 produces (eb) the spread of (e) the initially localized excitation.

(229) Since total polarization is conserved under (e&eb) H1, such process is commonly known as (=) "spin diffusion".

(230) Then, a new pulse sequence rotates (e&eb) all the spins 90 degrees and the irradiation with (e&eb) r.f. field produces (eb) a further truncation of the dipolar interaction along (e&eb) the rotating field.

(231) The resulting effective Hamiltonian −H2=− (H1+Σ) acts for (e&eb) another period t2.

(232) Observe that the reversal is not perfect but (e) Σ is a small term which is due to (e) truncations required to form (eb) the effective Hamiltonian.

(233) This constitutes (e) the "backwards" evolution period after which the local polarization at site 0th is measured.

(234) We notice that Σ acts as (=) a self-energy operator that may account for (e) interactions within (eb) the same Hilbert space, and thus is (=) just a Hermitian effective potential.

(235) However, it also may describe (eb) the interaction with (e&eb) a different subsystem that constitutes (e) the "environment".

(236) In the last case Σ=Δ−iΓ would also have (e) an imaginary (non-Hermitian) component.

(237) In this last case, evolution of observables should be described by (e) two coupled Lindblad or Keldysh equations for the density matrix requiring (e) a self-consistent evaluation of dynamics of the system and the environment.

(238) This last situation would make the analysis less straightforward and might hinder (e) the **essential physics**.

(239) Thus, we first focus on perturbations that ensure unitary evolution. An example discussed by Zangara et al. of this situation is (=) a second frozen spin chain interacting with (e&eb) the first through (e&eb) an Ising interaction.

(240) In these cases, a polarization echo is formed when (e) t2=t1, i.e. after a total evolution time 2t=t2+t1.

(241) The normalized amplitude is given by the spin autocorrelation function that accounts for (e) the observed local polarization, MPE(t)=⟨Ψeq|S−0(2t) S+0|Ψeq⟩⟨Ψeq|S−0S+0|Ψeq⟩,(15) where S−0(2t)=eiH1t/ħe−iH2t/ħS−0eiH2t/ħe−iH1t/ħ is (=) the local spin operator, expressed in the Heisenberg representation respect to (e&eb) the acting Hamiltonian H(τ)=H1θ(t−τ)−H2θ(τ−t). An equivalent definition of MPE (t) in terms of (e&eb) Sz0 (2t) Sz0 was also proved useful.

(242) The connection of this experimental observable with (e&eb) the concepts discussed so far are already hinted but not yet clarified by Eq. (15).

(243) Thus, we consider that the m+1 spins are arranged in (eb) a linear chain or in an odd sized ring where (e) spin-spin interaction is restricted to XY terms acting on (e&eb) nearest-neighbors.

(244) In this case the Wigner-Jordan spin-fermion mapping allows to (eb) describe the spins system as (=) a gas of non-interacting fermions in a 1-d lattice.

(245) In that problem, the initial excitation propagates as (e&eb) a single spinless fermion.

(246) In turn, the observed local polarization can be written back in terms of (e&eb) the evolution of (e) an initially localized **"spin wave":** |ψ0⟩=|↑0⟩⊗|↓1⟩⊗|↓2⟩⊗|↓3⟩⊗...⊗|↓m⟩,(16) where| |↑n⟩ (|↓n⟩) means that the n-th site is occupied (unoccupied).

(247) Thus, it is clear that the excitation at site 0-th can spread along (e&eb) the 1-d chain

through (e&eb) the nearest neighbor flip-flop interaction.

(248) This correspondence between many-body dynamics and (e&eb) spin wave behavior was worked out in detail by Danieli et al.

(249) This procedure was originally employed by (e) Pastawski et al. in the context of time-reversal experiments to predict (eb) the presence of Poincaré recurrences (mesoscopic echoes) which were clearly observed by (e) Mádi et al. at the laboratory of Richard Ernst in Zurich.

(250) In this condition, the polarization detected (eb) after the time-reversal procedure results: MPE(t)≡1dsystemwithXYinteractionM(t)=||⟨ψ0|eiH2t/ħe−iH1t/ħ|ψ0⟩||2.(17)

(251) Notice that here |ψ0⟩ denotes (=) a single particle wave function, there are no other operators than the propagators and (e&eb) the modulus square makes explicit the positivity of (e) MPE (t). These features that were not obvious in Eq. (15) and make it to agree with the definition of the Loschmidt echo of Eq. (1).

(252) Many other effective many-body Hamiltonians can be experimentally reversed to obtain (eb) the revival of different observables that reduce to (e) a detectable polarization.

(253) Thus it is now a common practice to loosely call Loschmidt echoes to (e&eb) the polarization resulting from (e) any of these possible spin dynamics reversal procedures, regardless of the applicability of (e&eb) the single particle correspondence, with (e&eb) an explicit mention of the observable used.

**Time-reversal of the dipolar many-spin interaction Refs. (Levstein et al. 1998; Usaj et al. 1998; Pastawski et al. 2000; Zurek et al. 2007)**

(254) Figure 11: Ferrocene crystal showing (eb) the 1H (small dots), C atoms (medium-sized dots) and Fe (large dots).

(255) A rare 13C nucleus (usually called a "spy" nucleus), acting as (e&eb) a local probe, is shown by the arrow.

(256) Polarization evolves in (eb) the H lattice. Fe atoms at the center are not (e) magnetically active, but when replaced by (e) Co atoms relaxation of polarization is achieved. Adapted from Ref. (Levstein et al. 1998). Copyright (1998), American Institute of Physics.

(257) The experiments have been carried out (e&eb) in different molecular crystals of the cyclopentadienyl (C5H5) family.

(258) There, 1H nuclei are arranged in five fold rings with (e&eb) strong intra-ring dipolar interactions which nevertheless are not (e) constrained to the molecule but also yield (eb) appreciable intermolecular couplings.

(259) Polarization can be injected on (e&eb) those 1H which are close to a "spy" 13C nucleus that acts as (e&eb) a local probe used to (e) inject and eventually detect (e&eb) local polarization as represented in Figure 11.

(260) Spreading of the initially localized spin excitation proceeds through (e&eb) a dipolar interaction which is truncated (e) either in the basis of external magnetic field (Laboratory frame) or in the rotating frame of a radio frequency field.

(261) This choice is crucial in order to achieve (eb) the change of the sign and the eventual scale down of (e) the effective Hamiltonian.

(262) Thus a spin dynamics with H1 in the Laboratory frame is reversed by (e&eb)a dynamics of H2 in the rotating frame or vice versa.

(263) The role of environment might be played by paramagnetic Co(II) or quadrupolar Mn nuclei that replace (e&eb) the Fe and thus they are absent for (e) pure ferrocene crystals.

(264) Besides, in pure ferrocene truncation in the rotating frame give rise to (eb) non-inverted non-secular terms which, being suppressed by (e) the corresponding Zeeman energy, are at most of the order of a few percent of the matrix elements of H2.

(265) This would yield (eb) a Hermitian Σ

(266) The strength of these terms is inversely proportional to (=) B1, the strength of the r.f. pulse, and thus one has the possibility to experimentally reduce (e) its importance by (e) increasing the r.f. power.

(267) Figure 12: Formation and fading away of the Loschmidt echo with reversal time t2= = elapsed after (e) different periods t1 of forward evolution.

(268) Notice that the tails of the first Loschmidt echo reflect (e&eb) the forward dynamics. At longer times there is a first revival associated with (e&eb) the neighbors and a small revival associated with (e&eb) the mesoscopic echo resulting from (e) the dynamics within the ring.

(269) Superimposed with the Loschmidt echo there are (e&eb) high frequency oscillations.

(270) These are coherent interferences resulting from (e) an incomplete transfer between the 13C, used as (=) a local probe, and the nearby 1H nuclei. Adapted from Ref. (Levstein et al. 1998). Copyright (1998), American Institute of Physics.

(271) The results showing the buildup of the Loschmidt echoes, under (e&eb) H2 after different periods of evolution with H1, are presented in Figure 12.

(272) The universal features of the Loschmidt echo appear when one studies the maximum recovered polarization (Loschmidt echo intensity) as (=) a function of t, the evolution time before reversal.

(273) In Ferrocene crystals, once one substrates the background noise it is clear that the Loschmidt echo follows a clear Gaussian law, M (t) =exp [−12 (tT3)2], (18) for over two orders of magnitude and serves as (=) a definition of the characteristic time T3.

(274) The same decay law is observed when, using (e) a specially tailored pulse sequence, the Hamiltonians are scaled down by (er) a factor n=1, 2, 8 and 16 respectively. i.e. the characteristic decay time is increased by (e) the factor n.

(275) The scaling of 1/T3 with the Hamiltonian strength is also observed when (e) H1 and H2 are scaled down by using different crystal orientations.

(276) Figure 13: Attenuation of the polarization echo in the ferrocene single crystal as a function of t for n=1 (REPE sequence). The line represents (eb) a Gaussian fitting. The inset shows the PE attenuation for progressively reduced (e) dipolar dynamics, n= 1, 2, 8, and 16. No asymptotic regime is reached within (eb) the experimental timescale. The solid lines are (=) Gaussian fittings. Adapted from Ref. (Usaj et al. 1998).

(277) In contrast to Ferrocene, in Cobaltocene crystals, one starts with a Gaussian decay, and as the dipolar Hamiltonian is scaled down, (eb) an exponential decay of the Loschmidt echo is developed and became stable with (e&eb) a characteristic time τSE.

(278) Figure 14: Attenuation of the polarization echo in the cobaltocene sample as (=) a function of t for n = 1, 2, 5, 8, and 16.

(279) The experimental data show a clear crossover between a dominant Gaussian attenuation to an exponential one. The solid lines represent fittings of the whole set of data to Eq. (19). Adapted from Ref. (Usaj et al. 1998).

(280) Thus, the overall behavior of the recovered local polarization is (=) $M(t)=\exp[-12(tnT3)2-t\tau SE]$.(19)

(281) One may assign this asymptotic exponential decay rate 1/τSE to (e) a Fermi Golden Rule decoherence rate induced by (e) the perturbation induced by (e) the paramagnetic nature of the Co(II) nuclei which acts as (e&eb) an environment.

(282) Further experiments by Pastawski et al. in crystals free of magnetic impurities confirmed (eb) the Gaussian decay with a rate 1/T3 that depends only weakly on (=) the r.f. power and, when (e) truncation terms becomes (=) too small, saturates to an intrinsic value that scales with (e&eb) the strength of the reverted Hamiltonian.

(283) In summary, these experiments hinted that there is (=) an intrinsic decoherence rate which is fixed by (e) the inverted Hamiltonian.

(284) Thus, other than the difference between the Gaussian and exponential decay, one might say that 1/T3 plays a role (e&eb) similar to the Lyapunov exponent in (eb) the reversal of chaotic one body systems.

(285) This surprising finding suggested that, even in absence of any important perturbation, in the experimental limit of $m\to\infty$, even very small residual terms, in presence of (e) the dynamical instability of a very complex many-body dynamics, are efficient enough to (e) set the Loschmidt echo decay into (e&eb) a perturbation independent decay regime.

(286) This plays the role of (e&eb) an "**intrinsic decoherence**" with (e&eb) a time scale determined by the inverted Hamiltonian.

(287) It was precisely the hypothesis of an "intrinsic decoherence rate" what triggered the (eb) theoretical analysis of (e) time-reversal in chaotic systems.

(288) Indeed, while dynamics of one body systems in 1D, described by Eq. (17), cannot be chaotic, one deems that disorder and the more complex many-body dynamics present in higher dimensional systems, have (e) mixing properties which makes them assimilable to (e) chaotic systems.

(289) This observation led to (eb) G. Usaj et al. to propose that quantum chaos contains (e) the underlying physics of (e) a time-reversal experiment in a many-body system.

(290) It was also argued that MPE (tR) constitutes (e) an entropy measure.

(291) These ideas finally boiled down into (e&eb) the model proposed by Jalabert and Pastawski.

(292) While Gaussian decays appears quite naturally as a consequence of (e) the large number statistics of many-spin states that are progressively incorporated into (e) the dynamics, the perturbation independent decay have (e) not found yet a straightforward explanation in this context.

**Further time-reversal Experiments Refs. (Levstein et al. 2004; Sánchez et al. 2007, 2009; Rufeil-Fiori et al. 2009; Ramanathan et al. 2011)**

(293) While time-reversal of different interactions is (=) a ubiquitous experimental tool in NMR, there are not so many studies devoted to grasp at the origins of the (in) efficiency of (e) such procedures.

(294) In particular, time-reversal was implemented using (e) different procedures and systems that range from 3d and quasi-1d crystals to (e&eb) molecules in oriented liquid crystalline phases. In these cases, also different initial states and effective Hamiltonians were studied.

(295) Of particular interest are the double quantum (DQ) Hamiltonians, $H1\equiv LoschmidtEchoforDQHDQ=\sum i,j\tilde{d}i,j[S+iS+j+S-iS-j].(20)$

(296) The notation $\tilde{d}$ for the interaction strength recalls at it is an effective Hamiltonians built up from (e) dipole-dipole interaction by (e) suitable pulse sequences whose effect is described with (e&eb) the help of the average Hamiltonian theory.

(297) Since HDQ does not commute with (e&eb) the polarization described by $\sum iSzi$, it gives (eb) a more mixing as dynamics explores (e&eb) different subspaces of the Hilbert space inducing (eb) the multiple quantum coherences.

(298) Besides HDQ, there are (=) high order terms that act as (e&eb) an environment whose instantaneous decoherence could be described by (e&eb) a Fermi Golden Rule.

(299) One experimental observation is that the larger the number of subspaces correlated by the interaction (coherences of high order) (eb) faster the decoherence.

(300) One of the interesting properties of 1d systems is that the dynamics induced by (e) a HDQ has (e) a precise correspondence with (e&eb) an XY chain.

(301) Thus, the Loschmidt echo is given by Eq. (17). In real systems, such as Hydroxyapatite (HAp), inter-chain interactions are (=) significative, quantum Zeno effect induced by (e) a strong dynamics along the chain prevents (e) the development of coherences beyond second order and Eq. (17) remains valid.

(302) This explains why the Loschmidt echo observed by Rufeil-Fiori et al. for the double quantum Hamiltonian shows (eb) a Loschmidt echo with (e&eb)an exponential decay described by (e) the Fermi golden rule.

(303) Figure 15: Loschmidt Echo experiment based on (e) HDQ and -HDQ, for (e) hydroxyapatite (HAp) (quasi-1d crystal) and Adamantane, a fully 3-d crystal. Here, the source of Σ is very small high order terms in (eb) the effective Hamiltonian.

(304) This decay contrasts with (e&eb) results for an Adamantane crystal, a highly connected 3d system.

(305) There, a Fermi-function like decay is indicative of (e) the two time scales. Each molecule has 16 spins which do not (e) have direct interactions, thus remain (eb) independent for short times until they interact through (e&eb) neighbor molecules.

(306) In this case decoherence remains weak while (e) intermolecular correlation builds up. Once neighboring molecules become fully coupled (eb) the density of directly connected states becomes (=) very high and the Fermi-golden-rule controlled (er&eb) exponential decay takes over.

(307) Spin dynamics in various liquid crystals was studied in series of papers whose aim was to reduce (e) the number of interacting spins to (e) those within each molecule.

(308) However, the experiences have shown that a number of residual interactions remain (eb) significative and this strongly compromises the effectiveness of the Loschmidt echo sequences.

**Microwave billiards Refs. (Schäfer et al. 2005a, 2005b; Höhmann et al. 2008; Bodyfelt et al. 2009; Köber et al. 2010, 2011)**

(309) Microwave-frequency electromagnetic waves in quasi-two-dimensional cavities are effectively governed by (e&eb) the Helmholtz equation, which is equivalent to (=) the stationary Schrödinger equation. This equivalence allows one to address the Loschmidt echo in laboratory experiments with microwave billiards.

(310) Quantities directly measured in microwave experiments are frequency-dependent scattering matrix elements, Sab (ν) and S′ab(ν), corresponding to (e&eb) the unperturbed and perturbed chaotic billiard systems, respectively

(311) Here, the indices a and b refer to the antennae (or scattering channels) involved in (e&eb) the experiment.

(312) The change from the frequency domain to (e&eb) the time domain is achieved by (e) the Fourier transforms, S^ab (t) =∫dνe−2πivtSab (ν) and S^′ab (t) =∫dνe−2πivtS′ab (ν), performed over (e&eb) an appropriate frequency window.

(313) The sensitivity of a scattering process to system perturbations are then quantified by (e) the scattering fidelity amplitude

(314) fab(t)=⟨S^∗ab(t)S^′ab(t)⟩⟨|S^ab(t)|2⟩⟨|S^ab(t)|2⟩−−−−−−−−−−−−−−−−−√,(21) where (e) the asterisk stands for the complex conjugation, and the angular brackets denote (eb) an ensemble average over different realizations of the experiment (e.g., different positions of scatterers, antennae, etc.).

(315) The scattering fidelity itself is (=) a real-valued quantity defined as Fab (t) =|fab (t)|2.

(316) The numerator in the right-hand-side of Eq. (21) quantifies (eb) correlations between scattering matrix elements of the unperturbed and (e&eb) perturbed system.

(317) The decay of the numerator however is dominated by (e) the decay of the autocorrelations, so that (e) the denominator is introduced to (e) compensate for the autocorrelation

contributions to the correlation decay.

(318) Figure 16: Correlation function C^ [S∗11, S′11] ∝⟨S^∗11 (t) S^′11 (t) ⟩. The experimental results for the autocorrelation are shown in black, while (e) the correlations of perturbed and unperturbed system are shown in gray/orange.

(322) In chaotic systems and in the case of a weak coupling of the measuring antennae to (e&eb) the system, the scattering fidelity is known to approach (e&eb) the Loschmidt echo for (e) a random initial state.

(323) This makes microwave billiards well suited for (e) experimental studies in the field.

(324) In particular, microwave studies provided compelling experimental evidence for the validity of some of the known decay regimes of (e) the Loschmidt echo for global and local Hamiltonian perturbations.

**Elastic waves Refs. (Lobkis et al. 2003; Gorin et al. 2006)**

(325) Sound waves that travel through (e&eb) an elastic medium are multiple scattered by (e&eb) its inhomogeneities generating (eb) a slowly decaying wave diffusion.

(326) **If no change occurs in the medium over time, (eb) the usually called coda waves are highly repeatable**, that is, for identical excitations the waveforms are (=) indistinguishable.

(327) While if the medium is perturbed, the change in the multiple scattered waves will result in (eb) an observable change in the **coda waves**.

(328) Lobkis and Weaver have measured the sensitivity to (e&eb) temperature changes of (e) elastic coda waves in (eb) aluminum alloy blocks.

(329) They used the cross correlation function between two signals obtained at (eb) different temperatures T1 and T2 $X(\varepsilon)=\int dtST1(t)ST2(t(1+\epsilon))\int dtS2T1(t)\int dtS2T2(t(1+\epsilon))-----------\sqrt{}$.(22) to evaluate the distortion that is defined as (=) $D(t)=-\ln(Xmax)$, where (e) the time dependence is (=) given by the "age" of the signal.

(330) If formulated as a scattering process, it is shown that $D(t) =-\ln [f(t)]$, where f (t) is the scattering fidelity that was introduced to analyze the fidelity decay in microwave billiards.

(331) For sufficiently chaotic dynamics in systems weakly coupled to (e&eb) decay channels, the scattering fidelity approaches (eb) the standard fidelity amplitude (the Loschmidt echo is (=) the absolute square of the fidelity amplitude).

(332) Figure 18: The distortion as a function of time for coda waves that travel in an aluminum alloy block at different temperatures. The thin lines correspond to (e&eb) measurements in different frequency ranges.

(333) The thick lines show the corresponding theoretical curves obtained using (e) Random matrix theory. Inset: Laboratory configuration. An aluminum specimen, typically with nonparallel faces and a defocusing cylindrical hole, is cooled in (eb) a vacuum as temperature and ultrasonic response are monitored.

(334) A reed relay isolates the response from the pulser. Adapted from Refs. (Lobkis et al. 2003; Gorin at al. 2006). Copyright (2003, 2006), American Physical Society. The results obtained in acoustic signals traveling in an aluminum blocks were understood using (e) the random matrix predictions for the standard fidelity (see Figure 18).

(335) A surprising and unexpected finding is that the scattering fidelity decay for blocks with (e&eb) chaotic and regular classical dynamics is explained by (e) the same random matrix expressions.

**Cold atoms Refs. (Andersen et al. 2003, 2004, 2006; Wimberger et al. 2006; Martin et al. 2008; Wu et al. 2009; Krivolapov et al. 2011; Ullah et al. 2011; Dubertrand et al. 2012)**

(336) The Loschmidt echo, or rather a quantity closely related to the Loschmidt echo, has been carefully studied in laboratory experiments with (e&eb) cold atoms trapped inside (e&eb) optical cavities.

(337) These experiments offer an atom-optics realization of the echo in (eb) two-dimensional quantum billiards with (e&eb) underlying chaotic or mixed classical dynamics.

(338) The basic idea underlying the experiments with atom-optics billiards is as follows. An effectively two-level atom, with (e&eb) the internal states denoted by $|1\rangle$ and $|2\rangle$, is initially prepared in a state $|1\rangle\otimes|\psi\rangle$, where (e) $|\psi\rangle$ stands for the spatial component of the initial state.

(339) A laboratory observation of the echo involves first exposing the atom to (e&eb) a sequence of microwave-frequency electromagnetic pulses and then measuring (eb) the probability P2 of finding the atom in the internal state $|2\rangle$.

(340) In the protocol targeting the Loschmidt echo, $||\langle\psi|eiH2t/\hbar e{-}iH1t/\hbar|\psi\rangle||2$, an atom is first irradiated with (e&eb) a so-called $\pi/2$ pulse, which changes (e&eb) the atomic state into (e&eb) an equiprobable superposition of $|1\rangle\otimes|\psi\rangle$ and $|2\rangle\otimes|\psi\rangle$.

(341) The pulse is practically instantaneous and introduces almost no change to (e) the spatial component of the state.

(342) Then, the atom is left to evolve in an optical trap for (e) a time t, during which components $|1\rangle$ and $|2\rangle$ of the atomic state propagate under (e&eb) Hamiltonians H1 and H2 respectively.

(343) The difference between H1 and H2 originates from (e) a difference in dipole interaction potentials exerted upon (e&eb) the states $|1\rangle$ and $|2\rangle$ by (e) the optical trap.

(344) Finally, another $\pi/2$ pulse is applied to (e&eb) the atom and the probability P2 of finding the atom in the internal state $|2\rangle$ is (=) measured; P2 turns out to be a quantity closely related to (e&eb) the Loschmidt echo.

(345) Realistic experiments however deal with (e&eb) thermal incoherent mixtures of initial states, rather than with pure states.

(346) As a result (eb) the echo amplitude, due to (e) an individual state of this thermal mixture, contributes to (e&eb) P2 with (e&eb) an effectively random phase, smearing out (e) the echo signal.

(347) In order to overcome (e) this difficulty, Andersen, Davidson, Grünzweig, and Kaplan addressed a new echo measure, $||\langle\psi|eiH2t/2\hbar eiH1t/2\hbar e{-}iH2t/2\hbar e{-}iH1t/2\hbar|\psi\rangle||2$, closely related to (e&eb) the Loschmidt echo. In their experiments, "two-level" atoms, initially prepared in (eb) the state $|1\rangle\otimes|\psi\rangle$, were successively exposed to (e&eb) (i) a $\pi/2$ pulse, (ii) evolution for (e) a time t/2, (iii) a $\pi$ pulse swapping the population of (e) the internal states $|1\rangle$ and $|2\rangle$, (iv) another evolution for a time t/2, (v) a $\pi/2$ pulse, and finally (vi) a measurement of P2.

(348) Under this protocol, each state of the thermal mixture contributed to (e&eb) the probability P2 with the same phase.

(349) This allowed for a reliable measurement of (e) the echo even for ensembles of (e) more than a million of thermally populated states.

(350) More recently, atom interferometry has also been used to investigate several aspects of time-reversal in (eb) quantum kicked rotor systems.

(351) Wu, Tonyushkin, and Prentiss studied the dynamics of (e) laser-cooled rubidium atoms subjected to (e&eb) periodically pulsed optical standing waves, as (=) an atom-optics realization of the kicked rotor.

(352) Their experiments have demonstrated that quantum fidelity of a system, that is (=) chaotic in the classical limit, can survive (eb) strong perturbations over long time without decay.

(353) In a similar setup, Ullah and Hoogerland have performed an experiment that demonstrated the possibility of using time-reversal evolution for (e) cooling atomic matter waves.

(354) The problem of fidelity decay in (eb)&e kicked atom-optics systems has recently drawn considerable interest among theoreticians.

**Time-reversal mirrors Refs. (Fink 1999; Calvo et al. 2008; Taddese et al. 2009)**

(355) Another time-reversal attempt conceptually close to (e&eb) the Loschmidt echo is that of (e) time-reversal mirrors, developed in (eb) the last twenty years.

(356) Such a procedure has been successfully implemented in various setups where (e0 classical waves propagate through (e&eb) a complex media (going from acoustic to electromagnetic waves).

(357) In the time-reversal mirror protocol an initially localized pulse is recorded by (e) a collection of receiver-emitter transducers during (e&eb) a time interval where (e) the wave suffers multiple scattering.

(358) The later re-emission of (e) the time-reversed signal by each transducer during (e&eb) an interval of time equal to (=) the recording one leads to (eb) the refocusing of the signal in the region of the original excitation.

(359) Two features of this protocol have lead to (eb) considerable surprise among the practitioners: even one transducer is enough to obtain (eb) a good reproduction of the original signal

(360) The quality of the refocusing was improved by (e) the complexity of the media yielding (eb) the multiple scattering of the waves.

(361) A semiclassical theory of time-reversal focusing can be built up in terms of propagators and classical trajectories. The two previous features can be acknowledged by the semiclassical theory.

(362) Time-reversal mirrors and (e&eb: AC=DC=0) Loschmidt echos differ (e&eb) since (e) the former aims (eb) the refocalization of a wave which is (=) localized in space and time, while (e) the latter attempt to (e) time-reverse a quantum state.

(363) A common aspect between both protocols is *(=) the fact that the Hamiltonian for the forward and backward evolutions can differ due to (e) modifications of the environment during (e&eb) the process.

(364) Time-reversal mirrors are not only conceptually important, but also have (e) very important technological applications as for example brain therapy, lithotripsy, nondestructive testing and telecommunications.

(365) Recently a sensor of perturbations was proposed and demonstrated combining the ideas of the Loschmidt echo and (e&eb) time reversal mirror in classical waves.

**Past, present, and future of the Loschmidt echo studies**

(366) Since the early discussions between Boltzmann and Loschmidt on irreversibility and (e&eb) time-reversal, it has been clearly established that chaos is (=) the source of the irreversibility in statistical mechanics.

(367) However, when considering the sources of irreversibility in (eb) a quantum system with (e&eb) a few degrees of freedom Quantum Mechanics, which is (=) the fundamental theory of the microscopic world, does not (e) allow for chaotic behavior in the sense in which the latter appears in Classical Mechanics.

(368) That is, there is no exponential separation between states with nearby initial conditions since (e) **quantum evolution is unitary**.

(369) Trying to understand the origin of (e) irreversibility in quantum mechanics, Asher Peres proposed in 1984 as an alternative, to study the stability of quantum motion owing to (e) perturbations in the Hamiltonian.

(370) In his seminal paper, Peres considered M (t), later called Loschmidt echo, as (=) a measure of sensibility and (e&eb) reversibility of quantum evolutions.

(371) He aimed to distinguish classically chaotic or integrable dynamics according to (e&eb) the speed at which the fidelity decays.

(372) Peres reached the conclusion that the long-time behavior of the fidelity (or saturation, following the terminology of section Chaotic dynamics) in classically chaotic systems is (=) characterized by (e) smaller values and smaller fluctuations as compared to (e&eb) the case of regular dynamics.

(373) In view of numerous possibilities of different behaviors that are allowed (eb) in regular systems, such a conclusion does not always hold.

(374) It is interesting to notice that Peres' article appeared almost at the same time than two other seminal works studying the relevance of the underlying classical dynamics for quantum properties. These are the random-matrix description of the statistical properties of classically chaotic systems by Oriol Bohigas and collaborators; and the understanding of the spectral rigidity from (e) a semiclassical analysis of periodic orbits proposed by Michael Berry.

(375) The field of Quantum Chaos developed building upon these founding ideas and most of the subsequent works were concerned with the spectral properties of (e) classically chaotic systems. Comparatively very little work was done along the Peres' proposal in the decade following it.

(376) Motivated by the puzzles posed by (e) echo experiments in extended dipolar coupled nuclear spin systems, Rodolfo Jalabert and Horacio Pastawski studied in 2001 the behavior of the Loschmidt echo for (e) classically chaotic systems.

(377) They found that, depending on the perturbation strength, the decay of the Loschmidt echo exhibits (eb) mainly two different behaviors

(378) For weak perturbations, the decay is exponential with (e&eb) the rate that depends on the perturbation strength and that is (=) given by the width of the local density of states (usually called the Fermi-golden-rule regime).

(379) For stronger perturbations, however, there is a crossover to (e&eb) a perturbation-independent regime, characterized by (e) an exponential decay with the rate equal to (eb)the average Lyapunov exponent of the underlying (e&eb) classical system.

(380) The connection of the quantum Loschmidt echo with (e&eb) the classical chaos generated (eb) a great activity in the field.

(381) Researches from different fields, such as quantum chaos, solid state physics, acoustics, and cold atom physics, have made important contributions towards understanding various aspects of the Loschmidt echo. During the first years of the last decade the studies were mainly focused on one-body aspects of the problem and on the connection between the Loschmidt echo and (e&eb)decoherence; many interesting experiments were also performed.

(382) In the last years, the interest has primarily been focused on various many-body aspects of the Loschmidt echo. For example, there are studies that consider the decay of the Loschmidt echo as (=) a signature of a quantum phase transition, or that concentrate on the relation between the

Loschmidt echo and (e&eb) the statistics of the work done by a quantum critical system when (e) a control parameter is quenched. In view of recent improvements in experimental many-body system techniques, the issue of the Loschmidt echo decay has become more concrete.

**Some of the more important open questions in the field are:**

(383) The Lyapunov (perturbation-independent) decay regime has been one of the most influential breakthroughs in (eb) the theory of the Loschmidt echo. However, an experimental observation of the regime in simple well-controlled systems is still lacking.

(384) The first experimental measure of the Loschmidt echo was done in (eb) a many-body spin system using (e) NMR techniques.

(385) However, theoretically little is known about (e&eb) the behavior of the Loschmidt echo in (eb) many-body systems. Very interesting experiments are now being carried on using NMR.

(386) The semiclassical theory of the Loschmidt echo has proved to be (=) a powerful tool to understand many aspects of (e) its behavior.

(387) But this approach has some well-recognized difficulties, such as the root search problem or the exponentially growing number of classical orbits needed for (e) the semiclassical expansion.

(388) Recently, a simple semiclassical dephasing representation of the Loschmidt echo was proposed that does not (e) suffer of the usual problems of the semiclassical theories. The range of validity is however unknown.

(389) There is a vast amount of work characterizing (eb) the decay regimes of (e) the Loschmidt echo as universal.

(390) For chaotic systems perturbed with (e&eb) global or local perturbations the behavior of the decay rate of the Loschmidt echo is (=) well established (see section Decay of the Loschmidt echo: different regimes).

(391) However, recent works in quantum maps that are (=) perturbed in all phase space, have (e) reported non-universal oscillatory behavior in (eb) the decay rate of the Loschmidt echo as (=) a function of (e) the perturbation strength.

(392) Deviations from (e) the perturbation independence are found usually in the form of (e&eb) oscillations around the Lyapunov exponent.

(393) Moreover, there are cases where deviations are considerably large rendering (eb) the Lyapunov regime non-existing.

(394) The fully understanding of this non-universal behavior (eb) that was also observed in a Josephson flux quit, is still lacking (Pozzo et al. 2007; García-Mata et al. 2011b).

(395) The semiclassical theory of the Lyapunov decay of the Loschmidt echo is based on (e) highly localized initial states and (e&eb) the diagonal approximation of the expression for M(t), shown in Figure 1.

(396) But recent results using (e) the semiclassical dephasing representation have shown a Lyapunov regime in (eb) the mean value of the fidelity amplitude ⟨m (t) ⟩ (García-Mata et al. 2011a; Zambrano et al. 2011).

(397) Systems with regular or fully chaotic dynamics are (=) rather exceptional in nature.

(398) A generic system has mixed phase space consisting of integrable islands immersed in (eb) a chaotic sea. Few general results are known about the Loschmidt echo in this scenario.

**Path integral approach to the quantum fidelity amplitude Jiri Vanicek, Doron Cohen**

(1) The Loschmidt echo is (=) a measure of quantum irreversibility and is determined by (e) the fidelity amplitude of (e) an imperfect time-reversal protocol.
(2) Fidelity amplitude plays an important role both in (e&eb) the foundations of quantum mechanics and its applications, such as (=) time-resolved electronic spectroscopy.
(3) Authors derive an exact path integral formula for (e) the fidelity amplitude and use it to obtain (eb) a series of increasingly accurate semiclassical approximations by (e) truncating an exact expansion of the path integral exponent.
(4) While the zeroth-order expansion results in (eb) a remarkably simple, yet nontrivial approximation for the fidelity amplitude, the first-order expansion yields (eb) an alternative derivation of the so-called "dephasing representation", circumventing (e) the use of semiclassical propagator as (=) in the original derivation.
(5) Authors also obtain approximate expression for fidelity based on (e) the second-order expansion, which resolves (e) several shortcomings of the dephasing representation.
**(6)** The rigorous derivation from the path integral permits (eb) the identification of sufficient conditions under which various approximations obtained becomes exact. Cite **as:arXiv: 1510.03140 [quant-ph] (or arXiv: 1510.03140v1 [quant-ph] for this version**) **©American Physical Society**

**Characterizing and Quantifying Quantum Chaos with Quantum Tomography Vaibhav Madhok, Carlos A. Riofrío, Ivan H. Deutsch**

(1) Authors explore quantum signatures of (e) classical chaos by studying the rate of information gain in (eb) quantum tomography.
(2) The tomographic record consists of (e) a time series of expectation values of (e) a Hermitian operator evolving under (e&eb) application of the Floquet operator of a quantum map that possesses (or lacks) (e&eb) time reversal symmetry.
(3) They find that the rate of information gain, and hence the fidelity of quantum state reconstruction, depends on (=) the symmetry class of the quantum map involved.
**(4)** Moreover, authors find an increase in information gain and hence higher reconstruction fidelities when (e) the Floquet maps employed increase in (eb) chaoticity.
**(5)** Authors make predictions for (e) the information gain and show that (eb) these results are well described by (e) random matrix theory in (eb) the fully chaotic regime.
**(6)** Authors derive analytical expressions for (e) bounds on information gain using (e) random matrix theory for (e) different class of maps and show that these bounds are realized by (e) fully chaotic quantum systems. **Cite as: arXiv: 1506.02708 [quant-ph] (or arXiv: 1506.02708v1 [quant-ph] for this version). ©American Physical Society**

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

**Remark 1:** The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{13})^{(1)}e^{(\hat{M}_{13})^{(1)}t}\ and\ (\hat{Q}_{13})^{(1)}e^{(\hat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it

suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13,14,15$ depend only on $T_{14}$ and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 2:** There does not exist any $t$ where $G_i(t) = 0\ and\ T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{(-(b_i')^{(1)} t)} > 0 \quad \text{for t} > 0$$

**Definition of** $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$ : 187

**Remark 3**: if $G_{13}$ is bounded, the same property have also $G_{14}\ and\ G_{15}$ . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)} G_{14}$ and by integrating

**Definition of** $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2$ *and* $\left((\widehat{M}_{44})^{(9)}\right)_3$ :

**Remark 43:** if $G_{44}$ is bounded, the same property have also $G_{45}\ and\ G_{46}$ . indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a_{45}')^{(9)}G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1/(a_{45}')^{(9)}$$

In the same way , one can obtain

$$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2/(a_{46}')^{(9)}$$

If $G_{45}\ or\ G_{46}$ is bounded, the same property follows for $G_{44}$ , $G_{46}$ and $G_{44}$ , $G_{45}$ respectively.

**Remark 44:** If $G_{44}$ *is* bounded, from below, the same property holds for $G_{45}\ and\ G_{46}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{45}$ is bounded from below.

**Remark 45:** If $T_{44}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t),t\right) = (b_{45}')^{(9)}$ then $T_{45} \to \infty$.

**Definition of** $(m)^{(9)}$ and $\varepsilon_9$ :

Indeed let $t_9$ be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t),t\right) < \varepsilon_9, T_{44}\,(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right), \quad t = log\frac{2}{\varepsilon_9}$ By taking now $\varepsilon_9$ sufficiently small one sees that $T_{45}$ is unbounded.
The same property holds for $T_{46}$ if $\lim_{t\to\infty}(b_{46}'')^{(9)}\left((G_{47})(t),t\right) = (b_{46}')^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

**Proof :** From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14},t)\right) - (a''_{14})^{(1)}(T_{14},t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

**Definition of** $v^{(1)}$ :- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

**Definition of** $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$ :-

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)}+(C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$ , we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(1)}(t)$ :-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(1)}(t)$ :-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)}G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important

consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

**Proof** : From global equations we obtain 387

$$\frac{d\nu^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t)\right) - (a''_{17})^{(2)}(T_{17}, t)\nu^{(2)} - (a_{17})^{(2)}\nu^{(2)}$$

**Definition of** $\nu^{(2)}$ :- $\boxed{\nu^{(2)} = \frac{G_{16}}{G_{17}}}$ 388

It follows 389

$$-\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_2)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right) \le \frac{d\nu^{(2)}}{dt} \le -\left((a_{17})^{(2)}\left(\nu^{(2)}\right)^2 + (\sigma_1)^{(2)}\nu^{(2)} - (a_{16})^{(2)}\right)$$

From which one obtains 390

**Definition of** $(\bar{\nu}_1)^{(2)}, (\nu_0)^{(2)}$ :-

For $0 < (\nu_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (\nu_1)^{(2)} < (\bar{\nu}_1)^{(2)}$

it follows $(\nu_0)^{(2)} \le \nu^{(2)}(t) \le (\nu_1)^{(2)}$

In the same manner , we get 391

$$\nu^{(2)}(t) \le \frac{(\bar{\nu}_1)^{(2)} + (\bar{C})^{(2)}(\bar{\nu}_2)^{(2)} e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)} - (\bar{\nu}_2)^{(2)}\right)t\right]}}{1 + (\bar{C})^{(2)} e^{\left[-(a_{17})^{(2)}\left((\bar{\nu}_1)^{(2)} - (\bar{\nu}_2)^{(2)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(2)} = \frac{(\bar{\nu}_1)^{(2)} - (\nu_0)^{(2)}}{(\nu_0)^{(2)} - (\bar{\nu}_2)^{(2)}}}$$

From which we deduce $(\nu_0)^{(2)} \le \nu^{(2)}(t) \le (\bar{\nu}_1)^{(2)}$ 392

If $0 < (\nu_1)^{(2)} < (\nu_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (\bar{\nu}_1)^{(2)}$ we find like in the previous case, 393

$$(\nu_1)^{(2)} \le \frac{(\nu_1)^{(2)} + (C)^{(2)}(\nu_2)^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_2)^{(2)}\right)t\right]}}{1 + (C)^{(2)} e^{\left[-(a_{17})^{(2)}\left((\nu_1)^{(2)} - (\nu_2)^{(2)}\right)t\right]}} \le \nu^{(2)}(t) \le$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(2)}(t)$ :- 395

$(m_2)^{(2)} \leq \nu^{(2)}(t) \leq (m_1)^{(2)}$, $\boxed{\nu^{(2)}(t) = \frac{G_{16}(t)}{G_{17}(t)}}$

In a completely analogous way, we obtain 396

$(\mu_2)^{(2)} \leq u^{(2)}(t) \leq (\mu_1)^{(2)}$, $\boxed{u^{(2)}(t) = \frac{T_{16}(t)}{T_{17}(t)}}$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

**Particular case :** 397

If $(a''_{16})^{(2)} = (a''_{17})^{(2)}, then\ (\sigma_1)^{(2)} = (\sigma_2)^{(2)}$ and in this case $(\nu_1)^{(2)} = (\bar{\nu}_1)^{(2)}$ if in addition $(\nu_0)^{(2)} = (\nu_1)^{(2)}$ then $\nu^{(2)}(t) = (\nu_0)^{(2)}$ and as a consequence $G_{16}(t) = (\nu_0)^{(2)} G_{17}(t)$

Analogously if $(b''_{16})^{(2)} = (b''_{17})^{(2)}, then\ (\tau_1)^{(2)} = (\tau_2)^{(2)}$ and then

$(u_1)^{(2)} = (\bar{u}_1)^{(2)}$if in addition $(u_0)^{(2)} = (u_1)^{(2)}$ then $T_{16}(t) = (u_0)^{(2)} T_{17}(t)$ This is an important consequence of the relation between $(\nu_1)^{(2)}$ and $(\bar{\nu}_1)^{(2)}$

**Proof** : From global equations we obtain 398

$$\frac{d\nu^{(3)}}{dt} = (a_{20})^{(3)} - \left((a'_{20})^{(3)} - (a'_{21})^{(3)} + (a''_{20})^{(3)}(T_{21}, t)\right) - (a''_{21})^{(3)}(T_{21}, t)\nu^{(3)} - (a_{21})^{(3)}\nu^{(3)}$$

**Definition of** $\nu^{(3)}$ :- $\boxed{\nu^{(3)} = \frac{G_{20}}{G_{21}}}$ 399

It follows

$$-\left((a_{21})^{(3)}\left(\nu^{(3)}\right)^2 + (\sigma_2)^{(3)}\nu^{(3)} - (a_{20})^{(3)}\right) \leq \frac{d\nu^{(3)}}{dt} \leq -\left((a_{21})^{(3)}\left(\nu^{(3)}\right)^2 + (\sigma_1)^{(3)}\nu^{(3)} - (a_{20})^{(3)}\right)$$

400

From which one obtains

For $0 < (\nu_0)^{(3)} = \frac{G^0_{20}}{G^0_{21}} < (\nu_1)^{(3)} < (\bar{\nu}_1)^{(3)}$

$$\nu^{(3)}(t) \geq \frac{(\nu_1)^{(3)} + (C)^{(3)}(\nu_2)^{(3)} e^{\left[-(a_{21})^{(3)}\left((\nu_1)^{(3)} - (\nu_0)^{(3)}\right)t\right]}}{1 + (C)^{(3)} e^{\left[-(a_{21})^{(3)}\left((\nu_1)^{(3)} - (\nu_0)^{(3)}\right)t\right]}} \quad , \quad \boxed{(C)^{(3)} = \frac{(\nu_1)^{(3)} - (\nu_0)^{(3)}}{(\nu_0)^{(3)} - (\nu_2)^{(3)}}}$$

it follows $(\nu_0)^{(3)} \leq \nu^{(3)}(t) \leq (\nu_1)^{(3)}$

In the same manner , we get 401

$$\nu^{(3)}(t) \le \frac{(\bar{\nu}_1)^{(3)}+(\bar{C})^{(3)}(\bar{\nu}_2)^{(3)}e^{\left[-(a_{21})^{(3)}\left((\bar{\nu}_1)^{(3)}-(\bar{\nu}_2)^{(3)}\right)t\right]}}{1+(\bar{C})^{(3)}e^{\left[-(a_{21})^{(3)}\left((\bar{\nu}_1)^{(3)}-(\bar{\nu}_2)^{(3)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(3)} = \frac{(\bar{\nu}_1)^{(3)}-(\nu_0)^{(3)}}{(\nu_0)^{(3)}-(\bar{\nu}_2)^{(3)}}}$$

**Definition of** $(\bar{\nu}_1)^{(3)}$ :-

From which we deduce $(\nu_0)^{(3)} \le \nu^{(3)}(t) \le (\bar{\nu}_1)^{(3)}$

If $0 < (\nu_1)^{(3)} < (\nu_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (\bar{\nu}_1)^{(3)}$ we find like in the previous case, 402

**Definition of** $(\bar{v}_1)^{(7)}, (v_0)^{(7)}$ :-

For $0 < \boxed{(v_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}}} < (v_1)^{(7)} < (\bar{v}_1)^{(7)}$

$$v^{(7)}(t) \ge \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_0)^{(7)}\right)t\right]}}{1 + (C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_0)^{(7)}\right)t\right]}} \quad , \quad \boxed{(C)^{(7)} = \frac{(v_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (v_2)^{(7)}}}$$

it follows $(v_0)^{(7)} \le v^{(7)}(t) \le (v_1)^{(7)}$

In the same manner , we get 417

$$v^{(7)}(t) \le \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(7)} = \frac{(\bar{v}_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (\bar{v}_2)^{(7)}}}$$

From which we deduce $(v_0)^{(7)} \le v^{(7)}(t) \le (\bar{v}_1)^{(7)}$

If $0 < (v_1)^{(7)} < (v_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}} < (\bar{v}_1)^{(7)}$ we find like in the previous case, 418

$$(v_1)^{(7)} \le \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_2)^{(7)}\right)t\right]}}{1 + (C)^{(7)}e^{\left[-(a_{37})^{(7)}\left((v_1)^{(7)} - (v_2)^{(7)}\right)t\right]}} \le v^{(7)}(t) \le$$

$$\frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}} \le (\bar{v}_1)^{(7)}$$

If $0 < (v_1)^{(7)} \le (\bar{v}_1)^{(7)} \le \boxed{(v_0)^{(7)} = \frac{G^0_{36}}{G^0_{37}}}$ , we obtain 419

$$(v_1)^{(7)} \le v^{(7)}(t) \le \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}}{1 + (\bar{C})^{(7)}e^{\left[-(a_{37})^{(7)}\left((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}\right)t\right]}} \le (v_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $v^{(7)}(t)$ :-

$$(m_2)^{(7)} \leq v^{(7)}(t) \leq (m_1)^{(7)}, \quad \boxed{v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(7)}(t)$ :- 420

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad \boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

**Particular case :**

If $(a''_{36})^{(7)} = (a''_{37})^{(7)}, then\ (\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(\nu_1)^{(7)} = (\bar{\nu}_1)^{(7)}$ if in addition $(\nu_0)^{(7)} = (\nu_1)^{(7)}$ then $v^{(7)}(t) = (\nu_0)^{(7)}$ and as a consequence $G_{36}(t) = (\nu_0)^{(7)} G_{37}(t)$ **this also defines** $(\nu_0)^{(7)}$ **for the special case** .

(1) The thermodynamic entropy production for the scattering processes of (e) noninteracting bosons

and fermions in mesoscopic systems is shown to be related to (e&eb) the difference between the Connes–Narnhofer–Thirring entropy per unit time, characterizing (eb) temporal disorder in (eb) the motion of quantum particles, and the associated (e&eb) time-reversed co entropy per unit time.

(2) Under nonequilibrium conditions, the positivity of (e) thermodynamic entropy production can thus be interpreted as (eb) a time-reversal symmetry breaking in (eb) the temporal disorder of the quantum transport process.

(3) Moreover, the full counting statistics of both fermionic and bosonic quantum transport is formulated in relation with (e&eb) the energy and particle currents producing (eb) thermodynamic entropy in (eb) nonequilibrium steady states. **Content from this work may be used under the terms of the Creative Commons Attribution 3.0 licence. Where $s_{(13)}$ represents integrand that is integrated over the interval [0, t]

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\hat{M}_{13})^{(1)}t}\leq \quad 186$$
$$\frac{1}{(\hat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\hat{A}_{13})^{(1)}+(\hat{P}_{13})^{(1)}(\hat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

**Remark 1:** The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{13})^{(1)}e^{(\hat{M}_{13})^{(1)}t}\ and\ (\hat{Q}_{13})^{(1)}e^{(\hat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it

suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13,14,15$ depend only on $T_{14}$ and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 2:** There does not exist any $t$ where $G_i(t) = 0\ and\ T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{(-(b_i')^{(1)} t)} > 0 \quad \text{for t} > 0$$

**Definition of** $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$ : 187

**Remark 3**: if $G_{13}$ is bounded, the same property have also $G_{14}\ and\ G_{15}$ . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)} \left((\widehat{M}_{13})^{(1)}\right)_1 / (a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)} \left((\widehat{M}_{13})^{(1)}\right)_2 / (a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for $G_{13}$ , $G_{15}$ and $G_{13}$ , $G_{14}$ respectively.

**Remark 4:** If $G_{13}$ *is* bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{14}$ is bounded from below. 188

**Remark 5:** If $T_{13}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}(G(t), t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

**Definition of** $(m)^{(1)}$ and $\varepsilon_1$ :

Indeed let $t_1$ be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right)$, $t = log\frac{2}{\varepsilon_1}$ By taking now $\varepsilon_1$ sufficiently small one sees that $T_{14}$ is unbounded.
The same property holds for $T_{15}$ if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}$ , $\frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1$ and to choose 190

$$\frac{(b_i)^{(9)}}{(\hat{M}_{44})^{(9)}}\left[\left((\hat{Q}_{44})^{(9)} + T_j^0\right)e^{-\left(\frac{(\hat{Q}_{44})^{(9)}+T_j^0}{T_j^0}\right)} + (\hat{Q}_{44})^{(9)}\right] \leq (\hat{Q}_{44})^{(9)}$$

In order that the operator $\mathcal{A}^{(9)}$ transforms the space of sextuples of functions $G_i$ , $T_i$ satisfying 39,35,36 into itself
The operator $\mathcal{A}^{(9)}$ is a contraction with respect to the metric

$$d\left(((G_{47})^{(1)}, (T_{47})^{(1)}), ((G_{47})^{(2)}, (T_{47})^{(2)})\right) =$$
$$\sup_i\{\max_{t\in\mathbb{R}_+}\left|G_i^{(1)}(t) - G_i^{(2)}(t)\right|e^{-(\hat{M}_{44})^{(9)}t}, \max_{t\in\mathbb{R}_+}\left|T_i^{(1)}(t) - T_i^{(2)}(t)\right|e^{-(\hat{M}_{44})^{(9)}t}\}$$

Indeed if we denote

**Definition of** $(\widetilde{G_{47}}), (\widetilde{T_{47}}) : \left((\widetilde{G_{47}}), (\widetilde{T_{47}})\right) = \mathcal{A}^{(9)}\left((G_{47}), (T_{47})\right)$
It results

$$\left|\tilde{G}_{44}^{(1)} - \tilde{G}_i^{(2)}\right| \leq \int_0^t (a_{44})^{(9)}\left|G_{45}^{(1)} - G_{45}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\,ds_{(44)} +$$
$$\int_0^t\{(a'_{44})^{(9)}\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{-(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right)\left|G_{44}^{(1)} - G_{44}^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}} +$$
$$G_{44}^{(2)}\left|(a''_{44})^{(9)}\left(T_{45}^{(1)}, s_{(44)}\right) - (a''_{44})^{(9)}\left(T_{45}^{(2)}, s_{(44)}\right)\right|\ e^{-(\widehat{M}_{44})^{(9)}s_{(44)}}e^{(\widehat{M}_{44})^{(9)}s_{(44)}}\}ds_{(44)}$$

Where $s_{(44)}$ represents integrand that is integrated over the interval [0, t]

From the hypotheses on 45,46,47,28 and 29 it follows

$$\left|(G_{47})^{(1)} - G^{(2)}\right|e^{-(\widehat{M}_{44})^{(9)}t} \leq$$
$$\frac{1}{(\widehat{M}_{44})^{(9)}}\left((a_{44})^{(9)} + (a'_{44})^{(9)} + (\widehat{A}_{44})^{(9)} + (\widehat{P}_{44})^{(9)}(\hat{k}_{44})^{(9)}\right)d\left(((G_{47})^{(1)}, (T_{47})^{(1)};\ (G_{47})^{(2)}, (T_{47})^{(2)})\right)$$

And analogous inequalities for $G_i$ *and* $T_i$. Taking into account the hypothesis (39,35,36) the result follows

**Remark 41:** The fact that we supposed $(a''_{44})^{(9)}$ and $(b''_{44})^{(9)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by

$(\widehat{P}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ *and* $(\widehat{Q}_{44})^{(9)}e^{(\widehat{M}_{44})^{(9)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(9)}$ and $(b_i'')^{(9)}, i = 44{,}45{,}46$ depend only on $T_{45}$ and respectively on $(G_{47})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 42:** There does not exist any $t$ where $G_i\,(t) = 0\ and\ T_i\,(t) = 0$

From 99 to 44 it results

$$G_i\,(t) \geq G_i^0 e^{\left[-\int_0^t\{(a_i')^{(9)}-(a_i'')^{(9)}(T_{45}(s_{(44)}),s_{(44)})\}ds_{(44)}\right]} \geq 0$$

$$T_i\,(t) \geq T_i^0 e^{(-(b_i')^{(9)}t)} > 0 \quad \text{for t} > 0$$

**Definition of** $\left((\widehat{M}_{44})^{(9)}\right)_1, \left((\widehat{M}_{44})^{(9)}\right)_2$ *and* $\left((\widehat{M}_{44})^{(9)}\right)_3$ :

**Remark 43:** if $G_{44}$ is bounded, the same property have also $G_{45}\ and\ G_{46}$ . indeed if

$G_{44} < (\widehat{M}_{44})^{(9)}$ it follows $\frac{dG_{45}}{dt} \leq \left((\widehat{M}_{44})^{(9)}\right)_1 - (a_{45}')^{(9)}G_{45}$ and by integrating

$$G_{45} \leq \left((\widehat{M}_{44})^{(9)}\right)_2 = G_{45}^0 + 2(a_{45})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_1/(a_{45}')^{(9)}$$

In the same way , one can obtain

$$G_{46} \leq \left((\widehat{M}_{44})^{(9)}\right)_3 = G_{46}^0 + 2(a_{46})^{(9)}\left((\widehat{M}_{44})^{(9)}\right)_2/(a_{46}')^{(9)}$$

If $G_{45}\ or\ G_{46}$ is bounded, the same property follows for $G_{44}$ , $G_{46}$ and $G_{44}$ , $G_{45}$ respectively.

**Remark 44:** If $G_{44}$ *is* bounded, from below, the same property holds for $G_{45}\ and\ G_{46}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{45}$ is bounded from below.

**Remark 45:** If $T_{44}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(9)}\left((G_{47})(t),t\right) = (b_{45}')^{(9)}$ then $T_{45} \to \infty$.

**Definition of** $(m)^{(9)}$ and $\varepsilon_9$ :

Indeed let $t_9$ be so that for $t > t_9$

$$(b_{45})^{(9)} - (b_i'')^{(9)}\left((G_{47})(t),t\right) < \varepsilon_9, T_{44}\,(t) > (m)^{(9)}$$

Then $\frac{dT_{45}}{dt} \geq (a_{45})^{(9)}(m)^{(9)} - \varepsilon_9 T_{45}$ which leads to

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{\varepsilon_9}\right)(1 - e^{-\varepsilon_9 t}) + T_{45}^0 e^{-\varepsilon_9 t}$ If we take t such that $e^{-\varepsilon_9 t} = \frac{1}{2}$ it results

$T_{45} \geq \left(\frac{(a_{45})^{(9)}(m)^{(9)}}{2}\right), \quad t = log\frac{2}{\varepsilon_9}$ By taking now $\varepsilon_9$ sufficiently small one sees that $T_{45}$ is unbounded.
The same property holds for $T_{46}$ if $\lim_{t\to\infty}(b_{46}'')^{(9)}\left((G_{47})(t),t\right) = (b_{46}')^{(9)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 92

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

**Proof :** From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14},t)\right) - (a''_{14})^{(1)}(T_{14},t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

**Definition of** $v^{(1)}$ :- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

**Definition of** $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$ :-

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)}+(C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$ , we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(1)}(t)$ :-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(1)}(t)$ :-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)}G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important

consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

**Proof** : From global equations we obtain 387

$$\frac{d\nu^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t)\right) - (a''_{17})^{(2)}(T_{17}, t)\nu^{(2)} - (a_{17})^{(2)}\nu^{(2)}$$

**Definition of** $\nu^{(2)}$ :- $\boxed{\nu^{(2)} = \frac{G_{16}}{G_{17}}}$ 388

The functions $(a''_i)^{(1)}, (b''_i)^{(1)}$ are positive continuous increasing and bounded.

**Definition of** $(p_i)^{(1)}$, $(r_i)^{(1)}$:

$(a_i'')^{(1)}(T_{14},t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$

$\lim_{G\to\infty}(b_i'')^{(1)}(G,t) = (r_i)^{(1)}$

**Definition of** $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$ :

Where $\boxed{(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}}$ are positive constants and $\boxed{i = 13,14,15}$

They satisfy Lipschitz condition: 99

$|(a_i'')^{(1)}(T_{14}',t) - (a_i'')^{(1)}(T_{14},t)| \leq (\hat{k}_{13})^{(1)}|T_{14} - T_{14}'|e^{-(\hat{M}_{13})^{(1)}t}$

$|(b_i'')^{(1)}(G',t) - (b_i'')^{(1)}(G,t)| < (\hat{k}_{13})^{(1)}||G - G'||e^{-(\hat{M}_{13})^{(1)}t}$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(1)}(T_{14}',t)$ and $(a_i'')^{(1)}(T_{14},t)$ . $(T_{14}',t)$ and $(T_{14},t)$ are points belonging to the interval $\left[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}\right]$. It is to be noted that $(a_i'')^{(1)}(T_{14},t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14},t)$ , the first augmentation coefficient attributable to the system, would be absolutely continuous.

**Definition of** $(p_i)^{(9)}$, $(r_i)^{(9)}$:

$$(a_i'')^{(9)}(T_{45}, t) \leq (p_i)^{(9)} \leq (\hat{A}_{44})^{(9)}$$

$$(b_i'')^{(9)}(G_{47}, t) \leq \ (r_i)^{(9)} \leq (b_i')^{(9)} \leq (\hat{B}_{44})^{(9)}$$

$$\lim_{T_2 \to \infty} (a_i'')^{(9)}(T_{45}, t) = (p_i)^{(9)}$$

$$\lim_{G \to \infty} (b_i'')^{(9)}(G_{47}, t) = \ (r_i)^{(9)}$$

**Definition of** $(\hat{A}_{44})^{(9)}, (\hat{B}_{44})^{(9)}$ :

Where $\boxed{(\hat{A}_{44})^{(9)}, (\hat{B}_{44})^{(9)}, (p_i)^{(9)}, \ (r_i)^{(9)}}$ are positive constants and $\boxed{i = 44,45,46}$

They satisfy Lipschitz condition:

$$|(a_i'')^{(9)}(T_{45}', t) - (a_i'')^{(9)}(T_{45}, t)| \leq (\hat{k}_{44})^{(9)} |T_{45} - T_{45}'| e^{-(\widehat{M}_{44})^{(9)} t}$$

$$|(b_i'')^{(9)}((G_{47})', t) - (b_i'')^{(9)}((G_{47}), t)| < (\hat{k}_{44})^{(9)} ||(G_{47}) - (G_{47})'|| e^{-(\widehat{M}_{44})^{(9)} t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(9)}(T_{45}', t)$ and$(a_i'')^{(9)}(T_{45}, t)$ . $(T_{45}', t)$ and $(T_{45}, t)$ are points belonging to the interval $\left[(\hat{k}_{44})^{(9)}, (\widehat{M}_{44})^{(9)}\right]$. It is to be noted that $(a_i'')^{(9)}(T_{45}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\widehat{M}_{44})^{(9)} = 1$ then the function $(a_i'')^{(9)}(T_{45}, t)$ , the **first augmentation coefficient** attributable to the system, would be absolutely continuous.

$$\frac{1}{(\widehat{M}_{44})^{(9)}}[(a_i)^{(9)} + (a_i')^{(9)} + (\hat{A}_{44})^{(9)} + (\hat{P}_{44})^{(9)}(\hat{k}_{44})^{(9)}] < 1$$

$$\frac{1}{(\widehat{M}_{44})^{(9)}}[(b_i)^{(9)} + (b_i')^{(9)} + (\hat{B}_{44})^{(9)} + (\hat{Q}_{44})^{(9)}(\hat{k}_{44})^{(9)}] < 1$$

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions $G_i, T_i$ satisfying Equations into itself

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric 185

$$d\left((G^{(1)},T^{(1)}),(G^{(2)},T^{(2)})\right)=$$

$$\sup_i\{\max_{t\in\mathbb{R}_+}|G_i^{(1)}(t)-G_i^{(2)}(t)|e^{-(\hat{M}_{13})^{(1)}t},\max_{t\in\mathbb{R}_+}|T_i^{(1)}(t)-T_i^{(2)}(t)|e^{-(\hat{M}_{13})^{(1)}t}\}$$

Indeed if we denote

**Definition of** $\tilde{G},\tilde{T}:(\tilde{G},\tilde{T})=\mathcal{A}^{(1)}(G,T)$

It results

$$\left|\tilde{G}_{13}^{(1)}-\tilde{G}_{i}^{(2)}\right| \leq \int_0^t (a_{13})^{(1)} \left|G_{14}^{(1)}-G_{14}^{(2)}\right| e^{-(\widehat{M}_{13})^{(1)}s_{(13)}} e^{(\widehat{M}_{13})^{(1)}s_{(13)}}\, ds_{(13)} +$$

$$\int_0^t \{(a'_{13})^{(1)} \left|G_{13}^{(1)}-G_{13}^{(2)}\right| e^{-(\widehat{M}_{13})^{(1)}s_{(13)}} e^{-(\widehat{M}_{13})^{(1)}s_{(13)}} +$$

$$(a''_{13})^{(1)}\left(T_{14}^{(1)}, s_{(13)}\right)\left|G_{13}^{(1)}-G_{13}^{(2)}\right| e^{-(\widehat{M}_{13})^{(1)}s_{(13)}} e^{(\widehat{M}_{13})^{(1)}s_{(13)}} +$$

$$G_{13}^{(2)} \left|(a''_{13})^{(1)}\left(T_{14}^{(1)}, s_{(13)}\right) - (a''_{13})^{(1)}\left(T_{14}^{(2)}, s_{(13)}\right)\right|\ e^{-(\widehat{M}_{13})^{(1)}s_{(13)}} e^{(\widehat{M}_{13})^{(1)}s_{(13)}}\} ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right| e^{-(\widehat{M}_{13})^{(1)}t} \leq \qquad (186)$$
$$\frac{1}{(\widehat{M}_{13})^{(1)}}\left((a_{13})^{(1)} + (a'_{13})^{(1)} + (\widehat{A}_{13})^{(1)} + (\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}\right) d\left(\left(G^{(1)}, T^{(1)};\ G^{(2)}, T^{(2)}\right)\right)$$

And analogous inequalities for $G_i$ *and* $T_i$. Taking into account the hypothesis the result follows

**Remark 1:** The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ *and* $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13,14,15$ depend only on $T_{14}$ and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 2:** There does not exist any $t$ where $G_i(t) = 0$ *and* $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{\left(-(b_i')^{(1)}t\right)} > 0 \quad \text{for t} > 0$$

**Definition of** $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2$ *and* $\left((\widehat{M}_{13})^{(1)}\right)_3$ : (187)

**Remark 3**: if $G_{13}$ is bounded, the same property have also $G_{14}$ *and* $G_{15}$ . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_1 / (a'_{14})^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)}\left((\widehat{M}_{13})^{(1)}\right)_2 / (a'_{15})^{(1)}$$

If $G_{14}$ *or* $G_{15}$ is bounded, the same property follows for $G_{13}$ , $G_{15}$ and $G_{13}$ , $G_{14}$ respectively.

**Remark 4:** If $G_{13}$ *is* bounded, from below, the same property holds for $G_{14}$ *and* $G_{15}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{14}$ is bounded from below. 188

**Remark 5:** If $T_{13}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}\,(G(t),t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

**Definition of** $(m)^{(1)}$ and $\varepsilon_1$ :

Indeed let $t_1$ be so that for $t > t_1$

$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t),t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right), \quad t = log\,\frac{2}{\varepsilon_1}$ By taking now $\varepsilon_1$ sufficiently small one sees that $T_{14}$ is unbounded.
The same property holds for $T_{15}$ if $\lim_{t\to\infty}(b_{15}'')^{(1)}\,(G(t),t) = (b_{15}')^{(1)}$

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

**Remark 36:** The fact that we supposed $(a''_{40})^{(8)}$ and $(b''_{40})^{(8)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{40})^{(8)}e^{(\widehat{M}_{40})^{(8)}t}\ and\ (\widehat{Q}_{40})^{(8)}e^{(\widehat{M}_{40})^{(8)}t}$ respectively of $\mathbb{R}_+$. 274

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(8)}$ and $(b_i'')^{(8)}, i=40,41,42$ depend only on $T_{41}$ and respectively on $(G_{43})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 37** There does not exist any $t$ where $G_i\,(t)=0\ and\ T_i\,(t)=0$ 275

it results

$$G_i\,(t)\ge G_i^0e^{\left[-\int_0^t\{(a_i')^{(8)}-(a_i'')^{(8)}(T_{41}(s_{(40)}),s_{(40)})\}ds_{(40)}\right]}\ge 0$$

$$T_i\,(t)\ge T_i^0e^{\left(-(b_i')^{(8)}t\right)}>0\quad \text{for t}>0$$

**Definition of** $\left((\widehat{M}_{40})^{(8)}\right)_1, \left((\widehat{M}_{40})^{(8)}\right)_2$ *and* $\left((\widehat{M}_{40})^{(8)}\right)_3$ : 276

**Remark 38:** if $G_{40}$ is bounded, the same property have also $G_{41}$ *and* $G_{42}$ . indeed if

$G_{40} < (\widehat{M}_{40})^{(8)}$ it follows $\frac{dG_{41}}{dt} \leq \left((\widehat{M}_{40})^{(8)}\right)_1 - (a'_{41})^{(8)} G_{41}$ and by integrating

$G_{41} \leq \left((\widehat{M}_{40})^{(8)}\right)_2 = G_{41}^0 + 2(a_{41})^{(8)}\left((\widehat{M}_{40})^{(8)}\right)_1/(a'_{41})^{(8)}$

In the same way , one can obtain

$G_{42} \leq \left((\widehat{M}_{40})^{(8)}\right)_3 = G_{42}^0 + 2(a_{42})^{(8)}\left((\widehat{M}_{40})^{(8)}\right)_2/(a'_{42})^{(8)}$

If $G_{41}$ *or* $G_{42}$ is bounded, the same property follows for $G_{40}$ , $G_{42}$ and $G_{40}$ , $G_{41}$ respectively.

**Remark 39:** If $G_{40}$ *is* bounded, from below, the same property holds for $G_{41}$ *and* $G_{42}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{41}$ is bounded from below. 277

**Remark 40:** If $T_{40}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(8)}((G_{43})(t),t)) = (b'_{41})^{(8)}$ then $T_{41} \to \infty$. 278

**Definition of** $(m)^{(8)}$ and $\varepsilon_8$ :

Indeed let $t_8$ be so that for $t > t_8$

$(b_{41})^{(8)} - (b_i'')^{(8)}\left((G_{43})(t),t\right) < \varepsilon_8, T_{40}(t) > (m)^{(8)}$

Then $\frac{dT_{41}}{dt} \geq (a_{41})^{(8)}(m)^{(8)} - \varepsilon_8 T_{41}$ which leads to 279

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{\varepsilon_8}\right)(1 - e^{-\varepsilon_8 t}) + T_{41}^0 e^{-\varepsilon_8 t}$ If we take t such that $e^{-\varepsilon_8 t} = \frac{1}{2}$ it results

$T_{41} \geq \left(\frac{(a_{41})^{(8)}(m)^{(8)}}{2}\right), \quad t = log\frac{2}{\varepsilon_8}$ By taking now $\varepsilon_8$ sufficiently small one sees that $T_{41}$ is unbounded.
The same property holds for $T_{42}$ if $\lim_{t\to\infty}(b''_{42})^{(8)}\left((G_{43})(t),t(t),t\right) = (b'_{42})^{(8)}$

It is now sufficient to take $\frac{(a_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}$ , $\frac{(b_i)^{(9)}}{(\widehat{M}_{44})^{(9)}} < 1$ and to choose $(\widehat{P}_{44})^{(9)}$ and $(\widehat{Q}_{44})^{(9)}$ large to have 279 A

$$\frac{(a_i)^{(9)}}{(\widehat{M}_{44})^{(9)}}\left[(\widehat{P}_{44})^{(9)} + \left((\widehat{P}_{44})^{(9)} + G_j^0\right)e^{-\left(\frac{(\widehat{P}_{44})^{(9)}+G_j^0}{G_j^0}\right)}\right] \leq (\widehat{P}_{44})^{(9)}$$

In order that the operator $\mathcal{A}^{(9)}$ transforms the space of sextuples of functions $G_i$ , $T_i$ satisfying 39,35,36 into itself
The operator $\mathcal{A}^{(9)}$ is a contraction with respect to the metric

$$d\left(((G_{47})^{(1)},(T_{47})^{(1)}),((G_{47})^{(2)},(T_{47})^{(2)})\right)=$$

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

**Proof :** From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

**Definition of** $v^{(1)}$ :- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

**Definition of** $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$ :-

For $0 < \boxed{(v_0)^{(1)} = \frac{G^0_{13}}{G^0_{14}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$v^{(1)}(t) \le \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}}$$

From which we deduce $(v_0)^{(1)} \le v^{(1)}(t) \le (\bar{v}_1)^{(1)}$

If $0 < (v_1)^{(1)} < (v_0)^{(1)} = \frac{G^0_{13}}{G^0_{14}} < (\bar{v}_1)^{(1)}$ we find like in the previous case, 385

$$(v_1)^{(1)} \le \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_2)^{(1)}\right)t\right]}}{1 + (C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_2)^{(1)}\right)t\right]}} \le v^{(1)}(t) \le$$

$$\frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}} \le (\bar{v}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$ , we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(1)}(t)$ :-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(1)}(t)$ :-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a_{13}'')^{(1)} = (a_{14}'')^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)} G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b_{13}'')^{(1)} = (b_{14}'')^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$$\frac{(\bar{\nu}_1)^{(9)}+(\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}}{1+(\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \leq (\bar{\nu}_1)^{(9)} \leq \boxed{(\nu_0)^{(9)} = \frac{G_{44}^0}{G_{45}^0}}$ , we obtain

$$(\nu_1)^{(9)} \leq \nu^{(9)}(t) \leq \frac{(\bar{\nu}_1)^{(9)}+(\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}}{1+(\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)}-(\bar{\nu}_2)^{(9)}\right)t\right]}} \leq (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(9)}(t)$ :-

$$(m_2)^{(9)} \leq \nu^{(9)}(t) \leq (m_1)^{(9)}, \quad \boxed{\nu^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(9)}(t)$ :-

$$(\mu_2)^{(9)} \leq u^{(9)}(t) \leq (\mu_1)^{(9)}, \quad \boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

**Particular case :**

If $(a''_{44})^{(9)} = (a''_{45})^{(9)}, then\ (\sigma_1)^{(9)} = (\sigma_2)^{(9)}$ and in this case $(\nu_1)^{(9)} = (\bar{\nu}_1)^{(9)}$ if in addition $(\nu_0)^{(9)} = (\nu_1)^{(9)}$ then $\nu^{(9)}(t) = (\nu_0)^{(9)}$ and as a consequence $G_{44}(t) = (\nu_0)^{(9)}G_{45}(t)$ **this also defines** $(\nu_0)^{(9)}$ **for the special case** .

Analogously if $(b''_{44})^{(9)} = (b''_{45})^{(9)}, then\ (\tau_1)^{(9)} = (\tau_2)^{(9)}$ and then $(u_1)^{(9)} = (\bar{u}_1)^{(9)}$if in addition $(u_0)^{(9)} = (u_1)^{(9)}$ then $T_{44}(t) = (u_0)^{(9)}T_{45}(t)$ This is an important consequence of the relation between $(\nu_1)^{(9)}$ and $(\bar{\nu}_1)^{(9)}$, **and definition of** $(u_0)^{(9)}$.

## Regularity And Chaos

### INTRODUCTION—VARIABLES USED

**Regularity and chaos in 0+ states of the interacting boson model using quantum measures S. Karampagia, Dennis Bonatsos, and R. F. Casten Phys. Rev. C 91, 054325 – Published 26 May 2015**

(1) Background: Statistical measures of chaos have long been used (e) in the study of chaotic dynamics in (eb) the framework of (e) the interacting boson model.
(2) The use of large numbers of bosons renders (eb) possible additional studies of chaos that can provide (eb) a direct comparison with similar classical studies of chaos.
(3) Purpose: Authors intend to provide complete quantum chaotic dynamics at (eb) zero angular momentum in (eb) the vicinity of the arc of regularity and link the results of the study of chaos using statistical measures with (e&eb) those of the study of chaos using classical measures.
(4) Method: Statistical measures of chaos are applied on (e&eb) the spectrum and the transition intensities of (e) 0+ states in the framework of (e) the interacting boson model.
(5) Results: The energy dependence of chaos is provided for the first time using (e) statistical measures of chaos. The position of the arc of regularity was also found to be (=) stable in the limit of large boson numbers
**(6)** Conclusions: The results of the study of chaos using statistical measures are consistent with (e&eb) previous studies using classical measures of chaos, as well as with (e&eb) studies using statistical measures of chaos, but for small number of bosons and states with angular momentum greater than 2. The operator $\mathcal{A}^{(9)}$ maps the space of functions satisfying 34,35,36 into itself .Indeed it is obvious that

$$G_{44}(t) \le G_{44}^0 + \int_0^t \left[(a_{44})^{(9)} \left(G_{45}^0 + (\hat{P}_{44})^{(9)} e^{(\hat{M}_{44})^{(9)} s_{(44)}}\right)\right] ds_{(44)} =$$
$$\left(1 + (a_{44})^{(9)} t\right) G_{45}^0 + \frac{(a_{44})^{(9)} (\hat{P}_{44})^{(9)}}{(\hat{M}_{44})^{(9)}} \left(e^{(\hat{M}_{44})^{(9)} t} - 1\right)$$

From which it follows that

$$(G_{44}(t) - G_{44}^0) e^{-(\hat{M}_{44})^{(9)} t} \le \frac{(a_{44})^{(9)}}{(\hat{M}_{44})^{(9)}} \left[((\hat{P}_{44})^{(9)} + G_{45}^0) e^{\left(-\frac{(\hat{P}_{44})^{(9)} + G_{45}^0}{G_{45}^0}\right)} + (\hat{P}_{44})^{(9)}\right]$$

$(G_i^0)$ is as defined in the statement of theorem 9

Analogous inequalities hold also for $G_{45}$ , $G_{46}, T_{44}, T_{45}, T_{46}$

It is now sufficient to take $\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}$ , $\frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$ and to choose 182

$(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ large to have

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}\left[(\hat{P}_{13})^{(1)}+\left((\hat{P}_{13})^{(1)}+G_j^0\right)e^{-\left(\frac{(\hat{P}_{13})^{(1)}+G_j^0}{G_j^0}\right)}\right]\leq(\hat{P}_{13})^{(1)} \quad 183$$

$$\frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}}\left[\left((\hat{Q}_{13})^{(1)}+T_j^0\right)e^{-\left(\frac{(\hat{Q}_{13})^{(1)}+T_j^0}{T_j^0}\right)}+(\hat{Q}_{13})^{(1)}\right]\leq(\hat{Q}_{13})^{(1)} \quad 184$$

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions $G_i$ , $T_i$ satisfying Equations into itself

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric 185

$$d\left(\left(G^{(1)},T^{(1)}\right),\left(G^{(2)},T^{(2)}\right)\right)=$$

$$\sup_i\{\max_{t\in\mathbb{R}_+}\left|G_i^{(1)}(t)-G_i^{(2)}(t)\right|e^{-(\hat{M}_{13})^{(1)}t},\max_{t\in\mathbb{R}_+}\left|T_i^{(1)}(t)-T_i^{(2)}(t)\right|e^{-(\hat{M}_{13})^{(1)}t}\}$$

Indeed if we denote

**Definition of** $\tilde{G},\tilde{T}:\left(\tilde{G},\tilde{T}\right)=\mathcal{A}^{(1)}(G,T)$

It results

$$\left|\tilde{G}_{13}^{(1)}-\tilde{G}_i^{(2)}\right|\leq\int_0^t(a_{13})^{(1)}\left|G_{14}^{(1)}-G_{14}^{(2)}\right|e^{-(\hat{M}_{13})^{(1)}s_{(13)}}e^{(\hat{M}_{13})^{(1)}s_{(13)}}ds_{(13)}+$$

$$\int_0^t\{(a'_{13})^{(1)}\left|G_{13}^{(1)}-G_{13}^{(2)}\right|e^{-(\hat{M}_{13})^{(1)}s_{(13)}}e^{-(\hat{M}_{13})^{(1)}s_{(13)}}+$$

$$G_{13}^{(2)}\left|(a''_{13})^{(1)}\left(T_{14}^{(1)},s_{(13)}\right)-(a''_{13})^{(1)}\left(T_{14}^{(2)},s_{(13)}\right)\right|\ e^{-(\hat{M}_{13})^{(1)}s_{(13)}}e^{(\hat{M}_{13})^{(1)}s_{(13)}}\}ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval [0, t]

From the hypotheses it follows

$$\left|G^{(1)}-G^{(2)}\right|e^{-(\hat{M}_{13})^{(1)}t}\leq \quad 186$$
$$\frac{1}{(\hat{M}_{13})^{(1)}}\left((a_{13})^{(1)}+(a'_{13})^{(1)}+(\hat{A}_{13})^{(1)}+(\hat{P}_{13})^{(1)}(\hat{k}_{13})^{(1)}\right)d\left(\left(G^{(1)},T^{(1)};\ G^{(2)},T^{(2)}\right)\right)$$

And analogous inequalities for $G_i$ *and* $T_i$. Taking into account the hypothesis the result follows

**Remark 1:** The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{13})^{(1)}e^{(\hat{M}_{13})^{(1)}t}$ *and* $(\hat{Q}_{13})^{(1)}e^{(\hat{M}_{13})^{(1)}t}$ respectively of $\mathbb{R}_+$.

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it

suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}, i = 13,14,15$ depend only on $T_{14}$ and respectively on $G(and\ not\ on\ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 2:** There does not exist any $t$ where $G_i(t) = 0\ and\ T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{\left[-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}\right]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{(-(b_i')^{(1)} t)} > 0 \quad \text{for t} > 0$$

**Definition of** $\left((\widehat{M}_{13})^{(1)}\right)_1, \left((\widehat{M}_{13})^{(1)}\right)_2\ and\ \left((\widehat{M}_{13})^{(1)}\right)_3$ : 187

**Remark 3**: if $G_{13}$ is bounded, the same property have also $G_{14}\ and\ G_{15}$ . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq \left((\widehat{M}_{13})^{(1)}\right)_1 - (a_{14}')^{(1)} G_{14}$ and by integrating

$$G_{14} \leq \left((\widehat{M}_{13})^{(1)}\right)_2 = G_{14}^0 + 2(a_{14})^{(1)} \left((\widehat{M}_{13})^{(1)}\right)_1 / (a_{14}')^{(1)}$$

In the same way , one can obtain

$$G_{15} \leq \left((\widehat{M}_{13})^{(1)}\right)_3 = G_{15}^0 + 2(a_{15})^{(1)} \left((\widehat{M}_{13})^{(1)}\right)_2 / (a_{15}')^{(1)}$$

If $G_{14}\ or\ G_{15}$ is bounded, the same property follows for $G_{13}$ , $G_{15}$ and $G_{13}$ , $G_{14}$ respectively.

**Remark 4:** If $G_{13}$ *is* bounded, from below, the same property holds for $G_{14}\ and\ G_{15}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{14}$ is bounded from below. 188

**Remark 5:** If $T_{13}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(1)}(G(t), t)) = (b_{14}')^{(1)}$ then $T_{14} \to \infty$. 189

**Definition of** $(m)^{(1)}$ and $\varepsilon_1$ :

Indeed let $t_1$ be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1}\right)(1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t}$ If we take t such that $e^{-\varepsilon_1 t} = \frac{1}{2}$ it results

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2}\right)$, $t = log\frac{2}{\varepsilon_1}$ By taking now $\varepsilon_1$ sufficiently small one sees that $T_{14}$ is unbounded.
The same property holds for $T_{15}$ if $\lim_{t\to\infty}(b_{15}'')^{(1)}(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}$ , $\frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1$ and to choose 190

$(R_2)^{(9)} = (b'_{46})^{(9)} - (r_{46})^{(9)}$

**Proof :** From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left( (a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t) \right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

**Definition of** $v^{(1)}$ :- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left( (a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)} \right) \le \frac{dv^{(1)}}{dt} \le -\left( (a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)} \right)$$

From which one obtains

**Definition of** $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$ :-

For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}}{1+(C)^{(1)} e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)}-(v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)}-(v_0)^{(1)}}{(v_0)^{(1)}-(v_2)^{(1)}}}$$

it follows $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\nu_1)^{(1)}$

In the same manner , we get 384

$$\nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{\nu}_1)^{(1)}-(\nu_0)^{(1)}}{(\nu_0)^{(1)}-(\bar{\nu}_2)^{(1)}}}$$

From which we deduce $(\nu_0)^{(1)} \leq \nu^{(1)}(t) \leq (\bar{\nu}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} < (\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{\nu}_1)^{(1)}$ we find like in the previous case, 385

$$(\nu_1)^{(1)} \leq \frac{(\nu_1)^{(1)}+(C)^{(1)}(\nu_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}}{1+(C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\nu_1)^{(1)}-(\nu_2)^{(1)}\right)t\right]}} \leq \nu^{(1)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\bar{\nu}_1)^{(1)}$$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$ , we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)}+(\bar{C})^{(1)}(\bar{\nu}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}}{1+(\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)}-(\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(1)}(t)$ :-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(1)}(t)$ :-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{13})^{(1)} = (a''_{14})^{(1)}, then\ (\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(\nu_1)^{(1)} = (\bar{\nu}_1)^{(1)}$ if in addition $(\nu_0)^{(1)} = (\nu_1)^{(1)}$ then $\nu^{(1)}(t) = (\nu_0)^{(1)}$ and as a consequence $G_{13}(t) = (\nu_0)^{(1)}G_{14}(t)$ this also defines $(\nu_0)^{(1)}$ for the special case

Analogously if $(b''_{13})^{(1)} = (b''_{14})^{(1)}, then\ (\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important

consequence of the relation between $(\nu_1)^{(1)}$ and $(\bar{\nu}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

$$\nu^{(4)}(t) \ge \frac{(\nu_1)^{(4)} + (C)^{(4)}(\nu_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_0)^{(4)}\right)t\right]}}{4 + (C)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_0)^{(4)}\right)t\right]}} \quad , \quad \boxed{(C)^{(4)} = \frac{(\nu_1)^{(4)} - (\nu_0)^{(4)}}{(\nu_0)^{(4)} - (\nu_2)^{(4)}}}$$

it follows $(\nu_0)^{(4)} \le \nu^{(4)}(t) \le (\nu_1)^{(4)}$

In the same manner , we get 405

$$\nu^{(4)}(t) \le \frac{(\bar{\nu}_1)^{(4)} + (\bar{C})^{(4)}(\bar{\nu}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)} - (\bar{\nu}_2)^{(4)}\right)t\right]}}{4 + (\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)} - (\bar{\nu}_2)^{(4)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(4)} = \frac{(\bar{\nu}_1)^{(4)} - (\nu_0)^{(4)}}{(\nu_0)^{(4)} - (\bar{\nu}_2)^{(4)}}}$$

From which we deduce $(\nu_0)^{(4)} \le \nu^{(4)}(t) \le (\bar{\nu}_1)^{(4)}$

If $0 < (\nu_1)^{(4)} < (\nu_0)^{(4)} = \frac{G^0_{24}}{G^0_{25}} < (\bar{\nu}_1)^{(4)}$ we find like in the previous case, 406

$$(\nu_1)^{(4)} \le \frac{(\nu_1)^{(4)} + (C)^{(4)}(\nu_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_2)^{(4)}\right)t\right]}}{1 + (C)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)} - (\nu_2)^{(4)}\right)t\right]}} \le \nu^{(4)}(t) \le$$

If $0 < (\nu_1)^{(8)} < (\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0} < (\bar{\nu}_1)^{(8)}$ we find like in the previous case, 423

$$(\nu_1)^{(8)} \leq \frac{(\nu_1)^{(8)}+(C)^{(8)}(\nu_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)}-(\nu_2)^{(8)}\right)t\right]}}{1+(C)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\nu_1)^{(8)}-(\nu_2)^{(8)}\right)t\right]}} \leq \nu^{(8)}(t) \leq$$

$$\frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\bar{\nu}_1)^{(8)}$$

If $0 < (\nu_1)^{(8)} \leq (\bar{\nu}_1)^{(8)} \leq \boxed{(\nu_0)^{(8)} = \frac{G_{40}^0}{G_{41}^0}}$ , we obtain 424

$$(\nu_1)^{(8)} \leq \nu^{(8)}(t) \leq \frac{(\bar{\nu}_1)^{(8)}+(\bar{C})^{(8)}(\bar{\nu}_2)^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}}{1+(\bar{C})^{(8)}e^{\left[-(a_{41})^{(8)}\left((\bar{\nu}_1)^{(8)}-(\bar{\nu}_2)^{(8)}\right)t\right]}} \leq (\nu_0)^{(8)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(8)}(t)$ :-

$$(m_2)^{(8)} \leq \nu^{(8)}(t) \leq (m_1)^{(8)}, \quad \boxed{\nu^{(8)}(t) = \frac{G_{40}(t)}{G_{41}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(8)}(t)$ :-

$$(\mu_2)^{(8)} \leq u^{(8)}(t) \leq (\mu_1)^{(8)}, \quad \boxed{u^{(8)}(t) = \frac{T_{40}(t)}{T_{41}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

**Particular case :**

If $(a''_{40})^{(8)} = (a''_{41})^{(8)}, then\ (\sigma_1)^{(8)} = (\sigma_2)^{(8)}$ and in this case $(\nu_1)^{(8)} = (\bar{\nu}_1)^{(8)}$ if in addition $(\nu_0)^{(8)} = (\nu_1)^{(8)}$ then $\nu^{(8)}(t) = (\nu_0)^{(8)}$ and as a consequence $G_{40}(t) = (\nu_0)^{(8)}G_{41}(t)$ **this also defines** $(\nu_0)^{(8)}$ **for the special case** .

Analogously if $(b''_{40})^{(8)} = (b''_{41})^{(8)}, then\ (\tau_1)^{(8)} = (\tau_2)^{(8)}$ and then $(u_1)^{(8)} = (\bar{u}_1)^{(8)}$if in addition $(u_0)^{(8)} = (u_1)^{(8)}$ then $T_{40}(t) = (u_0)^{(8)}T_{41}(t)$ This is an important consequence of the relation between $(\nu_1)^{(8)}$ and $(\bar{\nu}_1)^{(8)}$, **and definition of** $(u_0)^{(8)}$.

424

**Proof** : From 99,20,44,22,23,44 we obtain A

$$\frac{dv^{(9)}}{dt} = (a_{44})^{(9)} - \left((a'_{44})^{(9)} - (a'_{45})^{(9)} + (a''_{44})^{(9)}(T_{45},t)\right) - (a''_{45})^{(9)}(T_{45},t)v^{(9)} - (a_{45})^{(9)}v^{(9)}$$

**Definition of** $v^{(9)}$ :- $\boxed{v^{(9)} = \frac{G_{44}}{G_{45}}}$

It follows

$$-\left((a_{45})^{(9)}\left(v^{(9)}\right)^2 + (\sigma_2)^{(9)}v^{(9)} - (a_{44})^{(9)}\right) \le \frac{dv^{(9)}}{dt} \le -\left((a_{45})^{(9)}\left(v^{(9)}\right)^2 + (\sigma_1)^{(9)}v^{(9)} - (a_{44})^{(9)}\right)$$

From which one obtains

**Definition of** $(\bar{\nu}_1)^{(9)}, (\nu_0)^{(9)}$ :-

For $0 < \boxed{(\nu_0)^{(9)} = \frac{G^0_{44}}{G^0_{45}}} < (\nu_1)^{(9)} < (\bar{\nu}_1)^{(9)}$

$$v^{(9)}(t) \ge \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}}{1 + (C)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_0)^{(9)}\right)t\right]}} \quad , \quad \boxed{(C)^{(9)} = \frac{(\nu_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\nu_2)^{(9)}}}$$

it follows $(\nu_0)^{(9)} \le v^{(9)}(t) \le (\nu_9)^{(9)}$

In the same manner , we get

$$v^{(9)}(t) \le \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(9)} = \frac{(\bar{\nu}_1)^{(9)} - (\nu_0)^{(9)}}{(\nu_0)^{(9)} - (\bar{\nu}_2)^{(9)}}}$$

From which we deduce $(\nu_0)^{(9)} \le v^{(9)}(t) \le (\bar{\nu}_1)^{(9)}$

If $0 < (\nu_1)^{(9)} < (\nu_0)^{(9)} = \frac{G^0_{44}}{G^0_{45}} < (\bar{\nu}_1)^{(9)}$ we find like in the previous case,

$$(\nu_1)^{(9)} \le \frac{(\nu_1)^{(9)} + (C)^{(9)}(\nu_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}}{1 + (C)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\nu_1)^{(9)} - (\nu_2)^{(9)}\right)t\right]}} \le v^{(9)}(t) \le$$

$$\frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \le (\bar{\nu}_1)^{(9)}$$

If $0 < (\nu_1)^{(9)} \le (\bar{\nu}_1)^{(9)} \le \boxed{(\nu_0)^{(9)} = \frac{G^0_{44}}{G^0_{45}}}$ , we obtain

$$(\nu_1)^{(9)} \le v^{(9)}(t) \le \frac{(\bar{\nu}_1)^{(9)} + (\bar{C})^{(9)}(\bar{\nu}_2)^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}}{1 + (\bar{C})^{(9)}e^{\left[-(a_{45})^{(9)}\left((\bar{\nu}_1)^{(9)} - (\bar{\nu}_2)^{(9)}\right)t\right]}} \le (\nu_0)^{(9)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $v^{(9)}(t)$ :-

$$(m_2)^{(9)} \le v^{(9)}(t) \le (m_1)^{(9)}, \quad \boxed{v^{(9)}(t) = \frac{G_{44}(t)}{G_{45}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(9)}(t)$ :-

$(\mu_2)^{(9)} \leq u^{(9)}(t) \leq (\mu_1)^{(9)}$, $\boxed{u^{(9)}(t) = \frac{T_{44}(t)}{T_{45}(t)}}$

Now, using this result and replacing it in 99, 20,44,22,23, and 44 we get easily the result stated in the theorem.

**Particular case :**

If $(a''_{44})^{(9)} = (a''_{45})^{(9)}, then\ (\sigma_1)^{(9)} = (\sigma_2)^{(9)}$ and in this case $(\nu_1)^{(9)} = (\bar{\nu}_1)^{(9)}$ if in addition $(\nu_0)^{(9)} = (\nu_1)^{(9)}$ then $\nu^{(9)}(t) = (\nu_0)^{(9)}$ and as a consequence $G_{44}(t) = (\nu_0)^{(9)} G_{45}(t)$ **this also defines** $(\nu_0)^{(9)}$ **for the special case** .

Analogously if $(b''_{44})^{(9)} = (b''_{45})^{(9)}, then\ (\tau_1)^{(9)} = (\tau_2)^{(9)}$ and then
$(u_1)^{(9)} = (\bar{u}_1)^{(9)}$if in addition $(u_0)^{(9)} = (u_1)^{(9)}$ then $T_{44}(t) = (u_0)^{(9)} T_{45}(t)$ This is an important consequence of the relation between $(\nu_1)^{(9)}$ and $(\bar{\nu}_1)^{(9)}$, **and definition of** $(u_0)^{(9)}$.

**ASYMPTOTIC STABILITY ANALYSIS**

**Theorem 9:** If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(9)}\ and\ (b_i'')^{(9)}$ Belong to $C^{(9)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

And analogous inequalities for $G_i\ and\ T_i$. Taking into account the hypothesis the result follows

**Remark 31:** The fact that we supposed $(a''_{36})^{(7)}$ and $(b''_{36})^{(7)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{36})^{(7)}e^{(\widehat{M}_{36})^{(7)}t}\ and\ (\widehat{Q}_{36})^{(7)}e^{(\widehat{M}_{36})^{(7)}t}$ respectively of $\mathbb{R}_+$. 260

If instead of proving the existence of the solution on $\mathbb{R}_+$, we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(7)}$ and $(b_i'')^{(7)},i=36,37,38$ depend only on $\mathrm{T}_{37}$ and respectively on $(G_{39})(and\ not\ on\ \ t)$ and hypothesis can replaced by a usual Lipschitz condition.

**Remark 32:** There does not exist any $t$ where $G_i\,(t)=0\ and\ T_i\,(t)=0$ 261

it results

$$G_i\,(t)\ge G_i^0e^{\left[-\int_0^t\{(a_i')^{(7)}-(a_i'')^{(7)}(T_{37}(s_{(36)}),s_{(36)})\}ds_{(36)}\right]}\ge 0$$

$$T_i\,(t)\ge T_i^0e^{\left(-(b_i')^{(7)}t\right)}>0\quad \text{for t}>0$$

**Definition of** $\left((\widehat{M}_{36})^{(7)}\right)_1,\left((\widehat{M}_{36})^{(7)}\right)_2\ and\ \left((\widehat{M}_{36})^{(7)}\right)_3:$ 262

**Remark 33:** if $G_{36}$ is bounded, the same property have also $G_{37}\ and\ G_{38}$ . indeed if

$G_{36} < (\widehat{M}_{36})^{(7)}$ it follows $\frac{dG_{37}}{dt} \leq \left((\widehat{M}_{36})^{(7)}\right)_1 - (a'_{37})^{(7)} G_{37}$ and by integrating

$$G_{37} \leq \left((\widehat{M}_{36})^{(7)}\right)_2 = G_{37}^0 + 2(a_{37})^{(7)}\left((\widehat{M}_{36})^{(7)}\right)_1/(a'_{37})^{(7)}$$

In the same way , one can obtain

$$G_{38} \leq \left((\widehat{M}_{36})^{(7)}\right)_3 = G_{38}^0 + 2(a_{38})^{(7)}\left((\widehat{M}_{36})^{(7)}\right)_2/(a'_{38})^{(7)}$$

**Remark 34:** If $G_{36}$ *is* bounded, from below, the same property holds for $G_{37}$ *and* $G_{38}$ . The proof is analogous with the preceding one. An analogous property is true if $G_{37}$ is bounded from below. 263

**Remark 35:** If $T_{36}$ is bounded from below and $\lim_{t\to\infty}((b_i'')^{(7)}((G_{39})(t),t)) = (b'_{37})^{(7)}$ then $T_{37} \to \infty$. 264

**Definition of** $(m)^{(7)}$ and $\varepsilon_7$ :

Indeed let $t_7$ be so that for $t > t_7$

$$(b_{37})^{(7)} - (b_i'')^{(7)}((G_{39})(t),t) < \varepsilon_7, T_{36}(t) > (m)^{(7)}$$

Then $\frac{dT_{37}}{dt} \geq (a_{37})^{(7)}(m)^{(7)} - \varepsilon_7 T_{37}$ which leads to 265

$$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{\varepsilon_7}\right)(1 - e^{-\varepsilon_7 t}) + T_{37}^0 e^{-\varepsilon_7 t}$$ If we take t such that $e^{-\varepsilon_7 t} = \frac{1}{2}$ it results

$$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{2}\right), \quad t = log\frac{2}{\varepsilon_7}$$ By taking now $\varepsilon_7$ sufficiently small one sees that $T_{37}$ is unbounded.
The same property holds for $T_{38}$ if $\lim_{t\to\infty}(b''_{38})^{(7)}\left((G_{39})(t),t\right) = (b'_{38})^{(7)}$
We now state a more precise theorem about the behaviors at infinity of the solutions of equations

It is now sufficient to take $\frac{(a_i)^{(8)}}{(\hat{M}_{40})^{(8)}}$ , $\frac{(b_i)^{(8)}}{(\hat{M}_{40})^{(8)}} < 1$ and to choose 266

**Proof :** From global equations we obtain 383

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t)\right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

**Definition of** $v^{(1)}$ :- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$-\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)}\right) \le \frac{dv^{(1)}}{dt} \le -\left((a_{14})^{(1)}\left(v^{(1)}\right)^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)}\right)$$

From which one obtains

**Definition of** $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$ :-

For $0 < \boxed{(v_0)^{(1)} = \frac{G^0_{13}}{G^0_{14}}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \ge \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}}{1 + (C)^{(1)}e^{\left[-(a_{14})^{(1)}\left((v_1)^{(1)} - (v_0)^{(1)}\right)t\right]}} \quad , \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}}$$

it follows $(v_0)^{(1)} \le v^{(1)}(t) \le (v_1)^{(1)}$

In the same manner , we get 384

$$v^{(1)}(t) \le \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)}e^{\left[-(a_{14})^{(1)}\left((\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}}$$

From which we deduce $(v_0)^{(1)} \le v^{(1)}(t) \le (\bar{v}_1)^{(1)}$

If $0 < (\nu_1)^{(1)} \leq (\bar{\nu}_1)^{(1)} \leq \boxed{(\nu_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$ , we obtain 386

$$(\nu_1)^{(1)} \leq \nu^{(1)}(t) \leq \frac{(\bar{\nu}_1)^{(1)} + (\bar{C})^{(1)}(\bar{\nu}_2)^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}}{1 + (\bar{C})^{(1)} e^{\left[-(a_{14})^{(1)}\left((\bar{\nu}_1)^{(1)} - (\bar{\nu}_2)^{(1)}\right)t\right]}} \leq (\nu_0)^{(1)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(1)}(t)$ :-

$$(m_2)^{(1)} \leq \nu^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{\nu^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{20})^{(3)} = (a''_{21})^{(3)}, then\ (\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(\nu_1)^{(3)} = (\bar{\nu}_1)^{(3)}$ if in addition $(\nu_0)^{(3)} = (\nu_1)^{(3)}$ then $\nu^{(3)}(t) = (\nu_0)^{(3)}$ and as a consequence $G_{20}(t) = (\nu_0)^{(3)}G_{21}(t)$

Analogously if $(b''_{20})^{(3)} = (b''_{21})^{(3)}, then\ (\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)}T_{21}(t)$ This is an important consequence of the relation between $(\nu_1)^{(3)}$ and $(\bar{\nu}_1)^{(3)}$

**Proof** : From global equations we obtain 404

$$\frac{d\nu^{(4)}}{dt} = (a_{24})^{(4)} - \left((a'_{24})^{(4)} - (a'_{25})^{(4)} + (a''_{24})^{(4)}(T_{25},t)\right) - (a''_{25})^{(4)}(T_{25},t)\nu^{(4)} - (a_{25})^{(4)}\nu^{(4)}$$

**Definition of** $\nu^{(4)}$ :- $\quad \boxed{\nu^{(4)} = \frac{G_{24}}{G_{25}}}$

It follows

$$-\left((a_{25})^{(4)}\left(\nu^{(4)}\right)^2 + (\sigma_2)^{(4)}\nu^{(4)} - (a_{24})^{(4)}\right) \leq \frac{d\nu^{(4)}}{dt} \leq -\left((a_{25})^{(4)}\left(\nu^{(4)}\right)^2 + (\sigma_4)^{(4)}\nu^{(4)} - (a_{24})^{(4)}\right)$$

From which one obtains

**Definition of** $(\bar{\nu}_1)^{(4)}, (\nu_0)^{(4)}$ :-

For $0 < \boxed{(\nu_0)^{(4)} = \frac{G^0_{24}}{G^0_{25}}} < (\nu_1)^{(4)} < (\bar{\nu}_1)^{(4)}$

$$\nu^{(4)}(t) \geq \frac{(\nu_1)^{(4)}+(C)^{(4)}(\nu_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_0)^{(4)}\right)t\right]}}{4+(C)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_0)^{(4)}\right)t\right]}} \quad , \quad \boxed{(C)^{(4)} = \frac{(\nu_1)^{(4)}-(\nu_0)^{(4)}}{(\nu_0)^{(4)}-(\nu_2)^{(4)}}}$$

it follows $(\nu_0)^{(4)} \leq \nu^{(4)}(t) \leq (\nu_1)^{(4)}$

In the same manner , we get 405

$$\nu^{(4)}(t) \le \frac{(\bar{\nu}_1)^{(4)}+(\bar{C})^{(4)}(\bar{\nu}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}}{4+(\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}} \quad , \quad \boxed{(\bar{C})^{(4)} = \frac{(\bar{\nu}_1)^{(4)}-(\nu_0)^{(4)}}{(\nu_0)^{(4)}-(\bar{\nu}_2)^{(4)}}}$$

From which we deduce $(\nu_0)^{(4)} \le \nu^{(4)}(t) \le (\bar{\nu}_1)^{(4)}$

If $0 < (\nu_1)^{(4)} < (\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{\nu}_1)^{(4)}$ we find like in the previous case, 406

$$(\nu_1)^{(4)} \le \frac{(\nu_1)^{(4)}+(C)^{(4)}(\nu_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_2)^{(4)}\right)t\right]}}{1+(C)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\nu_1)^{(4)}-(\nu_2)^{(4)}\right)t\right]}} \le \nu^{(4)}(t) \le$$

$$\frac{(\bar{\nu}_1)^{(4)}+(\bar{C})^{(4)}(\bar{\nu}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}}{1+(\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}} \le (\bar{\nu}_1)^{(4)}$$

If $0 < (\nu_1)^{(4)} \le (\bar{\nu}_1)^{(4)} \le \boxed{(\nu_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}}$ , we obtain 407

$$(\nu_1)^{(4)} \le \nu^{(4)}(t) \le \frac{(\bar{\nu}_1)^{(4)}+(\bar{C})^{(4)}(\bar{\nu}_2)^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}}{1+(\bar{C})^{(4)}e^{\left[-(a_{25})^{(4)}\left((\bar{\nu}_1)^{(4)}-(\bar{\nu}_2)^{(4)}\right)t\right]}} \le (\nu_0)^{(4)}$$

And so with the notation of the first part of condition (c) , we have

**Definition of** $\nu^{(4)}(t)$ :-

$$(m_2)^{(4)} \le \nu^{(4)}(t) \le (m_1)^{(4)}, \quad \boxed{\nu^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}}$$

In a completely analogous way, we obtain

**Definition of** $u^{(4)}(t)$ :-

$$(\mu_2)^{(4)} \le u^{(4)}(t) \le (\mu_1)^{(4)}, \quad \boxed{u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

**Particular case :**
