3. Doctor, School of Business, University of Nairobi

Abstract
The broad objective of the study was to establish the influence of green marketing practices and Customer Satisfaction in the soft drink industry in Kenya. The specific objective was to establish the relationship between green marketing practices and Customer satisfaction in the Soft Drink industry in Nairobi Kenya. This study was anchored on consumer behavior theory and was guided by positivist philosophy. The study adopted a descriptive cross-sectional research design to determine how green marketing practices affect customer satisfaction in soft drink companies in Nairobi County, Kenya. The study targeted a sample of 180 trade customers and 162 soft drink firms but, the researcher managed to successfully collect data from 130 of the trade customers and 102 soft drink firms. Since Cronbach’s Alpha is the most commonly used measure of co-efficient of internal consistency, the study adopted the same. Descriptive statistics (mean scores and measures of dispersion) and inferential statistics (correlation, analysis of variance and regression analysis) was conducted to determine the expected relationships between green marketing practices and customer satisfaction. The study results revealed a statistically significant positive linear relationship between green marketing practices and customer satisfaction (β= .389, p-value = 0.002). The relationship was statistically significant because the p-value is less than the set value of 0.05 (p – value = 0.002). The regression results also showed that green marketing practices had explanatory power on customer satisfaction in the soft drink industry in Nairobi Kenya in that it accounted for 22.3 percent of its variability (R square = 0.223). Based on the overall study results obtained from the tests of the study hypotheses, it is concluded that there was a relationship between green marketing practices and customer satisfaction in the soft drink industry in Nairobi Kenya.

Acknowledgment
First and foremost, I would like to acknowledge the power of the almighty God for his sufficient grace, strength and courage to soldier on throughout the process of doing this thesis. I am greatly humbled by all the knowledge that I have acquired through others by the help of God.

I wish to acknowledge the entire PhD teaching and support staff at the University of Nairobi for the immense support accorded to me during the whole period of study. Special thanks go to my University Supervisors, Prof. Francis Kibera, Prof. Justus Munyoki and Dr. Mary Kinoti for their genuine guidance, time and efforts, invaluable advice, positive criticism and speedy feedback of the work as the project continued. I wish you Gods’ blessings. I highly acknowledge the immeasurable scholarly wealth of knowledge exhibited from panel members during my presentations that contributed a lot to my research completion.

I sincerely appreciate the logistical support provided by the Kenya Bureau of standards officials, all my respondents, research assistants and data analysts without whom this research work would not have been a reality. Thank you so much for all the necessary information accorded to me by all of you.

Finally special thanks and appreciation go to my larger family and friends for their love, encouragement and moral support. I wish you well in all your endeavors and God blessings.

Keywords: Green Marketing Practices, Customer Satisfaction, Soft Drink Industry, Nairobi Kenya

1.1 Background of the study
Green marketing refers to the promotion of environmentally safe products. Different scholars use various terminologies to describe green marketing. These include: green marketing, environmental marketing and ecological marketing (Polonsky, 1995). The American Marketing Association (AMA) refers green or ecological marketing as the study of the positive and negative aspects of marketing activities on pollution, energy depletion and non-energy resource depletion (Kinnear, 1973). AMA describes green marketing as the marketing of products that are presumed to be environmentally safe. It incorporates several activities such as product modification, changes to production processes, packaging, advertising strategies and also increases awareness on compliance marketing amongst industries. According to Srivastava (2007), green marketing is the integration of environmental thinking into product branding, including product design, material sourcing and selection, manufacturing processes, packaging of the final product to the consumers as well as end-of-life management of the product after its useful life. Polonsky (1995) refers to green marketing as consisting of all activities designed to generate and facilitate any exchanges intended to satisfy human needs, such that the satisfaction of these needs and wants occurs, with minimal detrimental impact on the natural environment.
Therefore, there is no universally accepted definition of green marketing. Polonsky’s description of green marketing will be used in this study since it incorporates most of the traditional components of the conventional marketing explanation and the protection of natural environment.

Green marketing incorporates a broad range of actions, including product modification, changes to the production process, packaging changes, as well as modifying advertising (Peattie, 2001). By creating social and environmental value, sustainability marketing tries to deliver and increase customer value. Similar to the modern marketing concept, sustainability marketing analyses customer needs and wants, develops sustainable solutions that provide superior customer value, and prices, distributes and promotes them effectively to selected target groups. This study has analyzed green marketing practices using the conventional 4Ps framework which consists: product, price, distribution and the promotion and the other two practices namely green brand positioning and processes.

Some of the green products practices available in the literature are product design, quality features, labeling, Packaging and positioning. Design dimensions of a greener product strategy covers a wide range of design for resources conservation and source decline, design for pollution avoidance, reconditioning, remanufacturing, disposability, reuse and recycling (Pujari & Wright, 1996). Packaging of products includes the general aspects of branding, design and layout of collateral, and broad components of the materials offered to consumers (Lieberman, 2002). The main requirement of the regulations is that no one who is responsible for packing or filling products into packaging or importing packed or filled packaging, may place that packaging on the market unless it fulfills the essential requirements and is within the heavy metal concentration limits. Environmental labeling of products is displayed by either using environmentally safe symbols or messages. Their primary aim is to inform the customer of the environmental safety characteristics of the product and assist corporation’s position themselves as environmentally concerned organizations (D’ Souza et al, 2006). Customers have a notion that green actions are expensive because of the premium prices firms charge for green products (Prakash, 2002). Consumers can convey their societal and environmental concerns by purchasing differentiated products and by willing to pay premiums. The premium prices arise as a result of extra costs firms incur in making a product or firm green. The literature on sustainability has largely examined the issue of willingness to pay and asserts that consumers generally accept that the prices of green products are relatively higher than those of their conventional counterparts (Harris & Freeman, 2008), and are even willing to pay more for them (Gam et al., 2010). Distribution logistics is of crucial importance in green product marketing. Environmental concerns has broadened the scale of distribution and logistics as well as influenced the way distribution and logistics managers perform their duties. With respect to broadening the scope of the logistics the salvage, disposal of scrap and packaging are now handled by logistics managers. Zhu et al (2005) state that green distribution issues range from green purchasing, integrated supply chains flowing to suppliers, to manufacturers, to consumers to reverse logistics.

Polonsky et al (1997) describes green promotion as activities of promoting products as having characteristics that do not harm the natural environment. According to Benerjee et al (1995) it should explicitly or implicitly addresses the relation between a product/service and the bio-physical environment, promote a green lifestyle with or without highlighting a product/service and/or presents a corporate image of environmental responsibility. Most buyers are influenced by advertisement that reflects a company’s commitment to environment (Polonsky & Ottman, 1998). Brand recognition and other reactions are created by the use of the product or service and through the influence of advertising, design, and media commentary (Johansen, 2003).

Brand positioning is based on the interaction of all marketing tools, with an accentuated role for marketing communications because of its relevance in the process of shaping distinct consumer perceptions. The brand’s added values are those that are relevant and appreciated by consumers and which are over and above the basic functional role of the product (Chernatony and McDonald, 1998). Aaker and Biel (1993) explain that the strength of a consumer’s brand attitude or perception may be one of the most significant components of overall brand strength. A green brand identity is described by specific set of brand attributes and benefits related to the reduced environmental impact of the brand and its perception as being environmentally sound. There is little doubt about the strategic importance of adequately defined brand associations and the relevant role of brand communication (Keller, 1993). Green branding comes in handy in assisting most organizations differentiate their products and services, associating them with environmentally safe products attributes and benefits.

Green process strategies involve developing and executing manufacturing and operation processes that reduce or eliminate wastes, reduce energy consumption, improve material utilization efficiency, and improve operational safety (Lin et al, 2001). Distinctive analysis model used to ascertain whether the process is environmental friendly includes; Life Cycle Analysis, design for the environment and ISO 14000 compliance. These analyses motivate managers to evaluate inputs and outputs (Kinoti, 2012). Life cycle analysis focuses on the analysis of the design and its associated design outputs; specifically it evaluates the types and quantities of product inputs such as, energy raw materials and product output such as atmospheric emissions, water and end product. Swenson and Wells (1997) view customer satisfaction as either an outcome or a process. An outcome as
satisfying the end state resulting from the consumption experience and a process as the perceptual evaluative and psychological process that contributes to satisfaction. The explanation is varied with regards to its level of simplicity which includes product satisfaction, satisfaction with the purchase decision experience, satisfaction with the performance attributes, satisfaction with the outlet or institution and satisfaction with pre-purchase experience (Wagner, 2003).

According to Oliver (1997) satisfaction refers to a consumer’s judgment that a product or service feature, or the product or service itself, was providing a pleasurable level of consumption-related fulfillment, including levels of under or over-fulfillment. Customer satisfaction can be seen as a fulfillment of consumer’s consumption goals as experienced and described by consumers (Oliver, 2006). Therefore, customer satisfaction is important for companies and other organizations in their efforts to improve product and service offerings and maintain customer loyalty in the face of growing intensity of green competition. Satisfaction also refers to a customer’s overall evaluation of how pleasurable their interaction with an organization is including the buying and use experience, relative to his or her expectations. It reflects a person’s comparative judgment resulting from a product’s perceived performance in relation to his or her expectations. It is an overall customer attitude or an emotional reaction to the difference between what customers anticipate and what they receive, regarding the fulfillment of some need, goal or desire (Ronald, 2010).

For call centers, support, and service desks, first call resolution is the honored grail. Service reflects on employee attitude and has been found to be a major determinant of Customer defections (Adams, 2006). Employee satisfaction, in turn results primarily from high quality support services and policies that enable employees to deliver results to customers (Capek, 2007; Heskett et al, 2008). For a company operation, product delivery and project implementation, on-time performance is the measuring stick. In a high transaction business, the first interaction with a customer will be a key determinant of whether the customer will return. Customer complaints can act as an indicator that the level of customer satisfaction is falling. It is very advisable not to rely solely on complaints for this purpose since research has consistently demonstrated that much customer satisfaction is never reported back to the suppliers, although it is usually voiced to colleagues, family and friends. Not all dissatisfied consumers complain, it is likely that many times complaints come in from consumers who are satisfied. It is evident that companies receive complaints from a small fraction of their total number of consumers (Oliver, 2006).

Complaints are generally seen as being expressions from consumers about dissatisfactory experiences. Viewed in this manner, complaints may be very useful for the firm in the discovering and eliminating product and marketing problems. A problem unrecognized is a problem unsolved. Complaints help firms recognize problems in the marketplace. As such, complaints are very useful indicators of market performance (Oliver, 1996). As far as customer satisfaction measurement is concerned it is useful to maximize customer communications as they provide valuable pointers to topics which should be covered in the customer survey and should certainly be incorporated into exploratory research (Crawford, 2007). The real reason of consumer complaints can stay hidden and complaints can stem also from unreasonable expectations, from the inability to understand if a problem really exists and from the incapability to use properly a product or a service. Even when a problem subsists, the consumer can be responsible of it or the cause can be a factor beyond both the consumer's and the manufacturer's control (Oliver, 1987).

The relevant marketing literature suggests that there is a relationship between customer satisfaction and loyalty. Satisfaction leads to attitudinal loyalty. It could be seen as the intention to purchase (Menon, 1999). Satisfaction is an outcome that occurs without comparing expectations and could also be an evaluative response to perceived outcome of a particular consumption experience. It is an overall judgment on satisfaction based on the assumption that satisfaction is the outcome of service quality. Therefore, green satisfaction (GS) is defined in this study as a pleasurable level of consumption-related fulfillment in order to satisfy specific green needs and environmental responsibilities (Chen, 2009). Customer satisfaction is closely linked to future purchase behaviour and willingness to recommend and is a strong predictor of loyalty and customer retention (Kabare, 2013). A satisfied customer will not complain but refer others to their service providers. This is determined by customer satisfaction assessment that is used to develop a strong value proposition, one that is persuasive, distinctive, measurable, dependable and sustainable (Krivobokova, 2009).

1.2 Statement of the problem
There is linkage in literature on the concepts of green marketing practices and customer satisfaction (Sihem & Mohamed, 2013; Chang & Fong, 2010; Klein et al, 1995). Green marketing practices have an influence on customer satisfaction (Sivesan & Umanakeman, 2013). There has been an argument whether green marketing practices contributes to competitive advantage. Some authors assert that environmental management may be a tool, which helps organizations to improve their competitiveness (Ambec & Lanoie, 2008; Hart, 1995; Porter & Van der Linde, 1995). However, others have questioned the value laden of ecological advocacy (Derek et al, 2013; Walley and Whitehead, 1994). Green marketing practices can help organizations get more customers and
make more money if it is customer satisfaction targeted and it is well implemented.

With consumers becoming more health-conscious, non-carbonates remain a key growth driver. The rising health awareness has also bolstered demand for juice and water, with manufacturers in all major soft drinks categories responding by diversifying their portfolios. The year 2013 saw increasing competition in the soft drinks market following the return of Pepsi Cola to the Kenyan market. This immediately led to a price war with Coca-Cola (TCC, 2007). Although soft drink companies could realize the benefits of energy efficiency to their business which motivates them to implement green technologies, there is a lack of knowledge about the factors affecting the green customer satisfaction in the soft drink industry in Kenya, which does not encourage the companies to benefit from green practices. The study suggested that soft drink companies can benefit more by adding value to their brand by enhancing their brand image and spreading awareness to customers about the environmental responsibility.

In Kenya several green marketing studies have been conducted but in relation to different variables and in different context (Kiongora, 2003; Kalama, 2007; Mwirigi, 2007; Oburu & Kinoti, 2012). All these studies focused on the green strategies the organizations employed but none of them addressed the issue of customer satisfaction in adopting the green marketing practices. Kinoti (2012) conducted a study on green marketing practices in relation to corporate Image, organization characteristics and performance of ISO 14000 certified organizations in Kenya. The study concluded that there was a positive relationship between green marketing practices and firm performance. In this regards the study recognized that customer satisfaction contributes greatly to firm performance and recommended that further studies should be conducted targeting consumer’s satisfaction on green marketing practices. The studies lacked framework to address the issue of customer satisfaction in the relationship between green marketing practices.

The current study brought together green marketing practices (enabler variables) customer satisfaction (dependent variable). As such, the researcher identified the knowledge gap with respect to research design, nature and the number of variables studied to answer the research question: ‘To what extent do Green marketing practices influence customer satisfaction under the Kenyan context?’

1.3 Objective of the study
To establish the relationship between green marketing practices and Customer satisfaction in the Soft Drink industry in Nairobi Kenya.

1.4 Hypothesis
H₁: There is a statistically significant relationship between green marketing practices and customer satisfaction.

2.1 Theoretical Review
2.2.2 The theory of consumer behaviour
The consumer behaviour theories contend that a consumer internal influences such as motivation, perception and attitudes interplay with external influences from reference groups, culture, social class and marketing activities and this shapes consumer’s needs and desires leading to a consumption decision process (Schiffman & Kanuk, 2007). Consumer behaviour theories that seek to explain how consumer perceptions and attitudes are formed include the theory of reasoned action (Fishbein & Ajzein, 1975), the theory of planned behaviour (Chiou, 1998), the theory of trying (Bagozi, 1992), the tri-component attitude model (Oliver, 1993) and expectancy disconfirmation model (Oliver, 1980). The general argument of these theories is that satisfaction is a result of the difference between expected and perceived performance. Customers compare performance expectations with the actual buying and the use experience. Therefore, firms aim to maximize customer satisfaction by managing expectations through appropriate marketing mix variables hence green marketing practices.

The tri-component theory states that the evaluation of satisfaction involves the interplay of three psychological components and results in formation of perceptions about the firm and its products or services (Oliver, 1993). The cognitive component relates to the thinking and evaluation process based on the qualitative superiority of the products given by the performance. It draws on the knowledge and perceptions that are acquired through direct experience with the attitude object and related information from various sources. The affective component relates to the consumer’s emotions or feelings about a particular product or brand while conative component deals with behavioural measures based on the interaction between the provider and the customer in the buying process (Schiffman & Kanuk, 2007). The interplay of these three elements as a consumer evaluates current stimuli in light of previous related information or expectations leads to formation of perception. Perception relates to corporate and brand image, expectations and perceived product value. This leads or translates to customer commitment, satisfaction and loyalty. Attribution theory and affective feelings state that if consumers attribute failure to meet expectations as the fault of the product, they will be more dissatisfied than if they attribute the failure to chance factors or their own behaviour. The concept of affective feelings postulates that the level of consumer satisfaction may be influenced by the positive/ negative feelings
that they associate with the product after its purchase and use (Oliver, 1993). Therefore the theory of consumer behaviour and its constituent theories cover the conceptual framework variables explaining the relationships.

### 2.3 Literature on Green Marketing Practices and Customer Satisfaction

Researchers have argued that going green can be a holistic business solution that adds value to the companies and their stakeholders and that it should be a basic part of the system (Polonsky, 1995; Porter & Van der Linde, 1995). Business continuity and sustainability depend on tackling environmental problems (Baker & Sinkula, 2005). Many corporations view green practices as different, isolated and fragmented sets of activities such as recycling, reducing pollution and energy conservation, while green businesses do not succeed in isolation (Baker & Sinkula, 2005; Nair & Menon, 2008). It is clear that there are economic and competitive opportunities behind the environmental improvements in each company; those improvements add value to both the organization and the customer (Porter & Van der Linde, 1995). In this regard customer satisfaction can result from environmental practices and to achieve this, both the organization and the stakeholders should be connected via a comprehensive green value chain in a sustainable manner.

Environmental issues have been tackled by many initiatives from the management and business scholars. Some of these initiatives are total quality environmental management (Banerjee, 1998), corporate environmentalism (Banerjee et al., 2003) and environmental marketing (Charter, 1992; Ottman, 1993). Banerjee (2002) has clarified that a long-term value to the shareholders is created by integrating the social and environmental issues to the business. This thesis has discussed how information on greenness impacts consumer decision making. This presupposes that consumers purchase products mainly based on products’ attributes. However, in some other cases, firm-level attributes (greenness of processes and systems) may be key for developing promotional strategies. Possibly consumers want to purchase green products from green firms. From a managerial perspective, if brand attributes are more outstanding, firms should invest in greening products, but if corporate images are more important, focusing on firm-level processes/systems is desirable (Prakash, 2000).

According to a survey composed of around 200 respondents in Taiwan, green product quality was positively linked to customer satisfaction but a negative relationship between green pricing and customer satisfaction (Chang & Fong, 2010). This study will contend with this conclusion in a different context of soft drink industry in Kenya. Rakhsha and Majidar (2011) studied the effects of green marketing mix on satisfaction and loyalty of customers of a dairy company in Iran. It was concluded that green marketing mix has significant effect on consumer satisfaction. By considering the effect of green marketing mix upon consumers’ satisfaction and the effect of satisfaction upon their loyalty, it can be assumed that companies can create competitive advantage in their organization through taking steps in making green marketing part of their overall marketing strategy (Chang & Fong, 2010). Therefore, it was important, to empirically examine the actual impact of green marketing practices on customer satisfaction.

### 2.8 Conceptual framework

The conceptual model presented here has been derived from the discussions presented in the literature review. The model is represented in terms of the relationship between green marketing practices and customer satisfaction. Green marketing practices element is treated as the independent variable and Customer satisfaction as the dependent variable. The green marketing practices relationship with customer satisfaction construct was hypothesized as shown in figure 2.1.

#### Independent variable

- Green Product
- Green Place
- Green Price
- Green Promotion
- Green Brand Positioning
- Green Process

#### Dependent variable

- Repeat Purchase/ Intentions to leave
- Customer Complaint Behaviour
- Overall level of satisfaction

### 3.1 Methodology and Design

The study adopted a descriptive cross-sectional research design to determine how green marketing practices, organizational demographics and perception impacted on customer satisfaction in soft drink companies in...
Nairobi, Kenya. A descriptive cross-sectional survey collects data to make deductions and conclusions about a population of interest (universe) and have been regarded as snapshots of the populations from which researchers collect data. It assisted the researcher in establishing whether significant associations among variables exist at some point in time (Cooper & Schindler, 2006). Raman (2008) found out cross-sectional studies have robust for effects of relationship studies. Descriptive survey design allows for the collection of large data from sizable population. This enables the researcher to provide a cohesive summary of issues or events as described by the participants (Sandelowski, 2000). The choice of this design was appropriate for the study since it utilizes a questionnaire as a tool of data collection. This is supported by Gall et al (2003) who asserted that this type of design enables one to obtain information with sufficient precision so that hypothesis can be tested properly. This type of design has recently been used in similar studies by Kabare, (2013); Njeru, (2013); and Kinoti, (2012).

3.2 Population
The study focused on two populations. Group one comprised of both locally and foreign owned registered soft drink firms operating within the boundaries of Nairobi County. As at December, 2014 there were one hundred and sixty two (162) listed companies (Kenya Bureau of Standards, 2014). The list of the soft drink companies is shown in Appendix 4. Group two comprised of trade customers of soft drink industries who have a direct link with the supplier/ manufacturers. The trade customers included distributors and wholesalers whose population was 341. The researcher considered this population appropriate because soft drink firms ware likely to have adopted green marketing practices owing to customers concerns on health and environment issues. The soft drink companies provided the links to their trade customers.

3.5 Sampling Procedure
The researcher used the formulae suggested by Fisher, Laing and Stoeckel (1985) for determining sample size of the trade customers. A sample size of 180 trade customers was used in the current study which was arrived at using the formula as follows:

\[ \frac{n}{1 + n/N} = \frac{Z^2(P)(1 - P)}{E^2} \]

Where

- \( n = \) the desired sample size (if the target population is greater than 10,000)
- \( nf = \) is the desired sample size (when the population is less than 10,000).
- \( N = \) the Population (in this case 341)
- \( Z = \) level of confidence expressed in standard deviations (\( Z = 1.96 \) at \( \alpha = 0.05 \)).
- \( P = \) Proportion of the sample assumed to possess a characteristic or attribute.
- \( E = \) maximum sampling error the researcher (user) is willing to accept in the results. At 95% level of confidence the allowable error (\( \alpha \)) is=0.05.

Random sampling by making a compiled complete list of all the elements in a population from the lists received from the suppliers, assigning each a number and then drawing a set of random numbers which identifies members of the population to be sampled was used to select sample elements.

3.4 Data Collection
The relevant data was collected from both secondary and primary sources. Primary data was collected on the study variables through the use of two semi-structured questionnaires: one for the manufacturers and another for their direct trade customers. Key informant method was used to administer questionnaires. Key informant method was recommended by Kumar, Stern and Anderson (1993). It is described as obtaining data from persons whose professional and/or organizational responsibilities indicate that they have knowledge about specific characteristics of the population being studied (Warheit, Bulh and Bell, 1978; O’cass et al., 2004). One respondent was interviewed in each firm. Some previous researchers have proposed the use of multiple informants, while other scholars have supported single informants giving the reason that they provide data that are reliable and valid as multiple informants (O’cass et al., 2004; Narver and Slater, 1998). This is consistent with previous studies that have used key informants method to study green marketing practices and customer satisfaction relationships (polomski et.al, 2011; Zebal and Kinoti, 2012). The study targeted three hundred and forty two (342) respondents of both manufacturers and trade customers.

3.5 Data Analysis
The data collected were first cleaned, coded and organized in a manner that facilitated analysis using the Statistical Package for Social Sciences (SPSS). Descriptive statistics (mean scores and measures of dispersion) and inferential statistics (correlation, analysis of variance and regression analysis) was conducted to determine
the expected relationships between green marketing practices, Organizational demographics, customer perception and Satisfaction. Saunders et. al (2009) emphasized on the importance of descriptive analysis since it forms the basis of correlation and experimental studies. Regression analysis was carried out to measure the relationship between variables and also establish the strength of linear association between the variables. A 95% confidence level was used in this study. The general formula for predicting customer satisfaction was presented by the model

\[ CS = \beta_0 + \beta_1 X_1 + \varepsilon \]

- **\( CS \)** = Customer satisfaction
- **\( \beta_0 \)** = intercept
- **\( \beta_1 \)** = beta coefficients
- **\( X_1 \)** represent dimensions of green marketing practices,
- **\( \varepsilon \)** is the error term

### 4.1 Study Findings

#### 4.1.1 Green Marketing Practices

Green marketing practices was assessed by six statements namely green product, green price, green place, green promotion, green brand positioning and green process. Table 4.1 presents the relevant result which shows that on the scale of 1 to 5 (where 5= the greatest extent and 1 is the lowest extent).

</tbody>
</table>

**Overall mean score=3.482**

**Source: Primary Data**

The study results revealed that green promotion had the highest mean score of 3.65 followed by the Green process with a mean score of 3.60. However, Green product (mean 3.35) and Green brand positioning (mean 3.34) had moderate intensity. Overall, the intensity of green marketing practices was considerably high (mean 3.482). The relatively high level of adoption of these practices in a country like Kenya could be attributed to the government regulations and customer concerns as a result of environmental awareness creation among other factors. This section also compares mean scores of respondents’ perceived soft drink manufacturers’ performance across the attributes of green marketing practices. These are compared to the levels of importance the intermediaries’ respondents placed on the respective features. The results were used to show the difference between customer expectation and actual attribute performance by the manufacturers.

#### 4.1.2 Customer Satisfaction

The level of customer satisfaction was assessed through trade customer respondents’ indication by three measures namely repeat purchases, complaint handling behavior and the overall customer satisfaction. To assess on the common features considered in satisfaction surveys, the soft drink manufacturers’ respondents were asked to indicate the extent to which their organization surveyed customer satisfaction on fourteen customer satisfaction constructs. This is presented in Table 4.2.

Overall mean score=3.815

Source: Primary Data

The results in Table 4.2 show that to develop a new brand we survey for features critical to quality (Mean 4.452) and also we conduct customer retention assessment often (mean 4.050) had the highest mean scores. However, we conduct surveys often to access customers image of our brand (mean 3.030) and to alter existing brand we survey for critical green product quality features (mean 2.950) all had moderate intensity. Overall, the level of customer satisfaction was considerably high (mean 3.815). The results reveal that at one-sample t-test comparison of the level of customer satisfaction mean score indicates differences that were all statistically significant. The extent of customer satisfaction varied from one firm to another. To develop a new brand we survey for features critical to quality had the highest difference (t-value = 32.184, p-value < 0.05) and it was followed by we conduct surveys often to access customers image of our brand (t-value=30.252, p-value < 0.05). On the other hand, the lowest difference was reported in we record customer complaints and follow ups are done (t-value=26.324, p-value < 0.05) followed by customer loyalty & retention (t-value=26.292, p-value < 0.05).

4.2 Relationship between Green Marketing Practices and Customer Satisfaction

The first objective of the study was to establish the relationship between green marketing practices and customer satisfaction in the soft drink industry in Nairobi Kenya. The study had postulated that the relationship between green marketing practices and customer satisfaction in the Soft Drink industry in Nairobi Kenya was statistically significant. The indicators of Green marketing practices are green product, green price, green place, green promotion, Green Brand Positioning and Green Process which were used to test the hypothesis stated as bellow.

H2: There is a statistically significant relationship between green marketing practices and customer satisfaction.

The aggregate mean score of customer satisfaction (dependent variable) were regressed on the aggregate mean score of green marketing practices (Independent variable) and the relevant results presented in Table 4.3. The stepwise regression analyses results of the green marketing practices predicting customer satisfaction. The regression analyses revealed that all the green marketing practices had positive influences on customer satisfaction with all of them having statistically significant effects at p< 0.05. The study results...
revealed a statistically significant positive linear relationship between green marketing practices and customer satisfaction ($\beta = .389$, p-value = 0.002). The relationship was statistically significant because the p-value is less than the set value of 0.05 (p-value = 0.002). The regression results also showed that green marketing practices had explanatory power on customer satisfaction in the soft drink industry in Nairobi Kenya in that it accounted for 22.3 percent of its variability ($R^2 = 0.239$) hence the study failed to reject hypothesis $H_A$.

a) Dependent Variable: Customer satisfaction

• Lever of significance, $\alpha = 0.05$

Source: Primary Data

Arising from the results in Table 4.3, the resulting simple linear regression model that can be used to predict the level of customer satisfaction in the soft drink industry in Nairobi Kenya for a one standard deviation improvement in green marketing can be expressed as:

$$CS = 4.906 + 0.489GM + \varepsilon$$

Where:

- $GM$ is the green marketing
- $CS =$ customer satisfaction
- $\varepsilon$ is the error term- random variation due to other unmeasured factors.

The standardized beta coefficient 0.398 represents the expected improvement in customer satisfaction for a unit standard deviation improvement in green marketing practices. This means that, holding other factors constant, a one standard deviation improvement in green marketing would raise the level of customer satisfaction by a factor of approximately 0.489 of a standard deviation. The study failed to reject the hypothesis and found out that there is a statistical relationship between green marketing practices and customer satisfaction.

5.1 Summary of the Findings

The results of the study revealed that the relationship between green marketing practices and customer satisfaction in the soft drink industry in Nairobi Kenya was statistically positive and also highly significant. This is because the p-value is less than the set value of 0.05 (p-value = 0.000). This agrees with the findings of Kabare (2013) who found that customer perception constructs, had the greatest positive and statistically significant effect on customer satisfaction in maize flour mills in Nairobi county Kenya. The results revealed that there was a significant positive relationship between green marketing practices, customer perception and organizational demographics on customer satisfaction in the soft drink industry in Nairobi Kenya.

5.2 Conclusion

Based on the overall study results obtained from the tests of the study hypotheses, it is concluded that there is a relationship between green marketing practices and customer satisfaction in the soft drink industry in Nairobi Kenya and the relationship is positive and statistically significant ($p< 0.05$). Also, dimensions in the green marketing practices as green issues in product, price, promotion, place, process and brand positioning have the significant relationship with customer satisfaction.
5.3 Implications of the Study
The implication of the results to the practice is that green marketing is a worthwhile strategy which the management should be committed to in order to gain competitive advantage in a competitive industry with changing dynamic marketing environment. The findings will therefore assist the marketing managers to convince the senior management and business owners on green marketing issues to be implemented due to widespread perception that green promotion may have a negative impact on sales due to “green wash” (Polonsky, 2001). Further, managers will realize that green marketing practices serve the purpose of dealing with the organization’s direct or indirect actual or potential negative impact to the environment in satisfying consumer needs. The findings will also help managers understand that businesses in all industries get affected by environmental concerns and therefore firms’ should be sensitive to these influences so as to remain competitive.
