A pattern for global policy: Excursion into the causes and implications of migration (African/European perspectives).

Moses Kumi Asamoah (Rev.)

Abstract
According to the UN Department of Economic and Social Affairs, in 2010 there were 200 million international migrant workers and their families. This figure excludes over 15 million refugees, those whose movement across a border has been forced by fear of persecution or violence. Labour migration is not simply from developing to developed countries. It is on record that some 60% of migrants live in developing countries. The number of African migrants attempting to enter Europe has increased remarkably during the past few years. For instance, in 2005, 22,939 illegal migrants were registered on the Italian Island of Lampedusa and between January and August, 2006, 14,567 newcomers arrived. Again in 2005, 11,781 African illegal migrants arrived at Spanish Canary Islands. Europe has therefore been perceived as immigrant continent.

The causes are conflicts, the slowdown in economic growth and significant unemployment in Africa. This immigration from African countries have come to be perceived as a burden and even a threat to economic growth, social coercion, cultural coherence and security of the West.

The purpose of this paper is to provoke discussions by exploring the causes and implications of migration in order to design more suitable migration policies in the 21st century. It was found out that violence and poverty were usually considered the push factors of Africans migration to Europe. Also, restrictive policies, anti-immigrant public discourse and dehumanizing treatments that accompanied them contributed to the marginalization and emotional isolation of African immigrants in Europe.

African governments are to explore avenues that could speed up their socio-economic, political and technological developments and must control illegal emigration from their continent. European protectionist and restricted trade policies must be regulated and international relations agreements, mutual calibrations and negotiations must be established between Europe and Africa.

1.1 Introduction
Migration involves people who move for various reasons across different geographical spaces. It is distinguished from mere mobility from one locality to nearby town. Article 13 of the Universal Declaration of Human Rights stipulates that everyone has the right to leave any country, including his/her own. This guarantee must be understood in the light of socio-economic realities and other factors that cause people to leave their place of origin to look for better opportunities and security elsewhere. This means migration is legally endorsed. It raises concerns only if it is abused or it is illegally made. Migration may be categorized into permanent or temporary, legal or illegal, regular or irregular. It could be internal or international, done out of choice or due to circumstances (forced) and may involve men, women and children. We could distinguish between push and pull factors that cause migration. Push factors include: inadequate employment opportunities combined with poor living conditions, including a lack of basic education and health provision.

Migration includes human trafficking which involves some form of movement of persons by another for the sole purpose of exploiting them in terms of their labour and services. Trafficking may encourage a number of illegal actions including abuses of the individual human right and violation of labour standards (UN special report, 2009).

Accurate data on migration is difficult to obtain because many migrant workers lack official status. However, according to the UN Department of Economic and Social Affairs, in 2010 there were 200 million international migrant workers and their families. This figure excludes over 15 million refugees, those whose movement across a border has been forced by fear of persecution or violence. It must be noted however that, labour migration is not simply from developing to developed countries. Statistics shows that 60% of migrants live in developing countries (ILO, 2005).

Europe has been perceived as immigrant continent. The number of African migrants attempting to enter Europe has increased remarkably during the past few years. For instance, in 2005, 22,939 illegal migrants were registered on the Italian Island of Lampedusa and between January and August, 2006, 14,567 newcomers arrived ((Human Right Watch,2005). Again in 2005, 11,781 African illegal migrants arrived at Spanish Canary Islands(Human Right Watch,2005). Besides, European countries sometimes recruit migrants to fill the labour and skill shortages that were predicted to rise in the coming years.
It is believed that Al Queda activities underpin North Africa immigrants in Europe. It is against this backdrop that in the West, immigration of people from developing country has been perceived as a problem in need of control. Since the mid 1970’s, opposition to immigration has been on the rise. With the slowdown in economic growth and significant unemployment, immigration from developing countries has come to be perceived as a burden and even a threat to economic growth and welfare of developed countries. In the post 9/11 era, latent feelings that non-Western immigrants also form an internal threat to social coercion, cultural coherence and security of the West, seemed to have increased.

Todaro (1969), who propounded the Neo-Classical Economic Theory maintains that migration is related to global supply and demand for labour. Nations with scarce labour supply and high demand will have high wages that pull immigrants in from nations with a surplus labour. The implication on the receiving country will be an increase in its population, increased market power, enjoyment of economics of scale due to low production cost, growth in immigrant tax revenue and development of the economy in general. In addition, the country will be able to sustain its social security policy and development of its technological infrastructure as migrants come with new technological capabilities.

Piore (1979) theorized the Segmented Labour Market Theory. He argued that first world economies are structured so as to require a certain level of immigration. They have a primary market of secure, well remunerated work and a secondary market of low wage work. The demand for immigrant labour at a time when Spain was experiencing high unemployment supports the principles of dual labor market theory (Piore 1979; King et al. 1997; Mendoza 1997; Viega 1999). According to the theory, the labor market is segmented into primary and secondary sectors (Piore 1979).

The relevance of this theory is that the host country may take advantage of the spill over effect of technological knowhow of immigrant. This will mean, after some time, they will not need many of such immigrants. The other side is that the presence of the immigrant may cause unemployment in the receiving country.

Sassen (1998) also argues from his World System Theory that international migration is a by-product of capitalism. Capitalist economy means free market economy where demand and supply interact to determine market price. There is no government control of the labour market or wages. The caution is that if care is not taken, there will be over reliance of immigrants (foreigners) who as the result of their position will then dictate what must be done in the country where they are immigrants. If they are not listened to, they may withdraw their services which will put that economy in a jeopardized situations.

The Africa migration picture
Africa is noted for its long history of migration within and beyond the vast continent. It is estimated that the number of people with African decent that live outside of the continent is close to 140 million, most in the Western Hemisphere (Shinn, 2008).

Migration within Africa has been engineered by commerce, pastoralism, natural disaster, wars and the search for employment. Pre-colonial movement of Africans explorers and labourers were unsystematised, and entire village, tribes and clans were known to have moved to escape ravages of internecine warfare or to avoid unfavorable agriculture and climatic conditions resulting in famine and drought (ECA, 1981). Migration during this time was meant for trade and evangelization. In Africa, countries with emigration rate that far exceeds the global average are Cape Verde, Equatorial Guinea, Sao Tome and Principe, Lesotho and Mali. These are relatively small countries in terms of population compared to the average African country. They normally have narrow or limited livelihood opportunities and dependency on specific commodity for trade. Again, a country like Eritrea where there was extended war for 30 years, we had a massive wave of refugee that migrated to different parts of the world (Docquier and Schiff, 2009). Halton and Williamson (2003) affirm that countries that experience large scale conflict and war contribute to periodic instability in net movement of people in Africa.

Mention must be made of the fact that intra-African migration is also driven by the complexities of the history of state formation where colonial borders overlooked often linguistic and ethnic commonalities as well as waves of internal and cross borderer conflicts. That reflects migration in search of job opportunities across neighbouring countries. The existence of a community in the country of destination to whom the migrant can identify and fit easily also facilitate migration. For instance where there are linguistic, historical and religious ties. Migrant from Burundi, Rwanda fit in Uganda and Tanzania. Migrant from Ethiopia, Eritrea and Somalia fit among themselves (AbebeShimeless, 2010). Emigrant from Burkina Faso, Guinea Bissau and Mali normally migrate to Code
D’ivoire. Normally, Ghana is the destination for immigrant from Niger, Nigeria and Chad. Migrant from Mozambique, Swaziland, Lesotho normally have South Africa as their destination.

We can as well look at what factors cause migration from Africa to Europe. Massey et al. (1993) maintain that social networks sustain migration by mutually connecting migrants and non-migrants in relationships through which information and assistance are transmitted. Again, post independent Africa countries maintain close economic, political, cultural and linguistic relations with colonial powers that continued to this day. For instance France, Belgium and U.K maintain special relation with their former colonies in Africa. This includes privilege to travel, study and business opportunities. Anglophone countries normally travel to U.K and Francophone countries to France (e.g privileges of membership of commonwealth of nations)

The cumulative effect of past migration could also facilitate further outflows from Africa. This is because immigrants in the European countries help remove the constraints to emigration to aspiring emigrants in the country of origin in many ways such as, financing trips, facilitating information and reducing the burden of settlement.

Migration from Africa to Europe is also propelled by demographic and labour market pressure. The general notion is that, the prospect for the young and unemployed could be found in developed countries. Massey et al, (1994) points out that most empirical evidence suggest that a crucial impetus for international migration is the combination of systemic unemployment in the sender population and good employment prospects in the receiving population.

Increased possibility for migrants and their families to live transnationally and adopt transnational identities through revolutions in communications and transport infrastructure has influenced migration to the West (Vectovec,1999). This has enabled migrants to foster double loyalties, travel back and forth, to relate with people, to work and do many business simultaneously in distant places.

Besides, significant differences in living standards between underdeveloped, developing, (such as countries in Africa) and developed countries such as those in Europe move others from Africa to Europe. However the ability to make the decision and pay for travelling expenses and stay there will determine the migration rate (HDR, 2009). In fact this is why those in poor regions remain in neighbouring countries where they can afford the travelling expenses. Wages gap between African and European countries serve as incentive to migrate (Halton and Williamson, 2003).

Another cause of migration has to do with the failure of existing economic, political and social structures to provide equal right and just opportunities for women. This has contributed to the feminization of poverty leading to feminization of migration as women leave their homes in search of viable economic options and to enjoy human dignity and respect. Women are normally not involved in major decisions and leadership positions.

1.2 Methodology, sample and data analysis strategy

Primarily this research centres on the qualitative paradigm. Face to face indeph-interview strategy was deployed in the collection of data. In qualitative research, we are concerned with meanings attributed to events and experiences by participants in their naturally occurring environments (Willig, 2001). It is normally based on specific context and usually describes the real world settings of people to better understand social realities, processes, meanings, patterns and structural features (Golafshani, 2003). Each interview lasted about 2 hours and were either face-to-face or telephone based depending on the availability of the informants.

Twelve (12) experts from various backgrounds: Geographers, political scientists, Economists and Psychologists some of whom have been immigrants in Europe and Africa were purposefully sampled and interviewed on their experiences when they were immigrants. Out of the 12 participants, 5 of them were immigrants in their respective country of destination including Germany, Norway, Barbados, America and U.K. The range of their duration of stay is between 3 to 7 years. The age structure among them is between 40 to 55 years. One of the participants although had not been an immigrant in a particular country per se yet has a lot of travelling experience in various countries in Africa including Chad, Cameroune, Liberia, Nigeria, Sierraleon.

Interviewees included Dr Joseph Osafo a Clinical Psychologist and Suicidologist, a Ghanaian lecturer with the University of Ghana. He stayed in Norway for three years with his wife and 3 children during his doctor of philosophy programme. Dr Osafo is eight years in the field of teaching. Also Aku Hafron, a Psychology lecturer with Central University College was interviewed. She was in Barbados for three years during her Master of Philosophy work and has been in the teaching field for eight years. In addition, Dr. Futagbi, a Ghanaian, Biblical Counsellor, a Psychologist and a lecturer with Central University College who stayed in U.S for seven years and has been in the teaching practice for six years was interviewed. In addition, two Reverend ministers
Freeman Tete, a lecturer with Central University College and W.W.W. Marfo of Assemblies of God Church in Ghana were also interviewed. Rev. Tete has been in church work for over fifteen years and been teaching in the University for 11 years. Rev. Marfo a district pastor, has been in pastoral work for twenty-five years with his church.

Again, I conducted interviews with Dr. Edward Amponsah, Rev. Isaac Adjapong and Mrs Edna Adjapong. Dr. Amponsah is a Ghanaian, health Economist and a lecturer with the University of Ghana. He has been in the field of teaching for nine years. He stayed in Germany for three years during his PHD work. Rev. Adjapong, a Ghanaian, is the general overseer of Gospel Results Chapel and has been in pastoral work for ten years. He is a lecturer with Christian University College -Ghana. Rev. Adjapong has travelled to several countries in Africa including Cameroun, Chad, Nigeria, Liberia and Sierra Leone. Mrs Edna Adjapong is an historian and a teacher in a secondary school. The participant age range is between 39-45 years and is all Ghanaians.

Besides, I had an interview with Dr. K. Owusu, concerning the political perspective of migration. Dr Owusu is a Ghanaian, Political Scientist and a lecturer with the department of Political Science in the University of Ghana. He has been in the teaching field for three years.

Courtesy and respect were accorded the interviewees during the interview encounter. Some questions asked were what are the causes of migration? What are the psychological and cultural implications of migration? What are the perceived political and economic causes and implications of migration?

Desktop research: secondary data were also gathered from relevant books and articles. Sources of information have been intentionally acknowledged.

1.3 Justification and objectives of the research

Migration is a constant global activity and a critical social issue that needs attention and effective management. The intensity of it and related implications provoke intelligent research and discussions on the subject. The purpose of this paper is to discuss the causes and the implications of migration from African and European perspectives to inform suitable global migration policies for the 21st century.

2. Analysis of findings

As confirmed by literature, participants interviewed showed clearly that there are causes and socio-cultural and psychological implications for migration as depicted by the participants below:

When people in socio-centric (communal/interdependent societies) cultures migrate to egocentric (individualized/self-dependent) societies they feel more alienated. They lack the sense of belongingness. They have the feeling of cultural homelessness. Uncomfortable feelings and experiences are reported by migrants (Participant 1).

An African migrant from a socializing culture like Ghana where life and challenges are shared who as a result of migration is jettisoned into an opposite culture, is more likely to feel a sense of alienation and develop stress. Migration often necessitates fundamental changes in what food people eat and how it is prepared thus forcing old nutritional habits and customs to be sacrificed in order to adapt to new lifestyle. For example, breast feeding is often taken for granted in industrialized societies where more pressure and influence of formula foods have helped erode breast feeding (Participant 2)

Another participant provided the narrative below:

If the movement involves the whole family, it might result in high financial expenditures that may be too high for migrants, with eventual consequence for developing psychological distress. The problem of racism is a very serious psychological issue. This causes frustration, a feeling of rejection from the new culture resulting in lack of confidence in migrants which subsequently translates into mental health difficulties such as inferiority complex and feelings of marginalization (Participant 3)

Also, trying to compete with the host people for a decent life is threatened. Stress is again developed which when not managed immediately may lead to mental disorders (Participant 4)

The below statement is a view point of one of the participants:

Acculturation starts in the host country. This is also associated with stress. The difficulty in learning the language of the receiving country creates linguistic uncertainty. Also, it takes a lot of energy and tact to relate well to people one is meeting for the first time in the host country. The fact that immigrants clearly see they are not welcome or accepted in the new culture alone creates mental torment daily (Interview 5).
Additionally, accommodation and unemployment challenges create psychological trauma. For example, residence and work permit documentation process may cause immigrants to be frustrated or stranded. In pursuing these processes, immigrants may exhaust all their money and yet may be denied. This may lead to mental disorders such as depression, anxiety disorders and personality disorders when not properly managed (Participant 6). Where migrants leave their family behind, separation anxiety may result. The bonding of children to parents reduces and may disappear entirely after some time due to the separation. Foster and surrogate mothers may not be able to show proper care, and might also abuse these children. The situation is worsened when there is poor or no remittances. The tendency of these children suffering from child labour or and forced labour will be high (Participant 5). Also, in the case where the wife is the migrant, remittances from her may be mismanaged or misallocated, as normally the husband or guardian may channel it into acquisition of assets and other projects that might not be a priority compared to for instance the education of the children left behind. The children then suffer and their future becomes blurred. When these children are able to find a way to communicate their plight to the migrant mother, marital tension may result between the couple and if not managed well, divorce may result (Participant 7).

There are times that marriage by contract may be entered into by the immigrant normally with the aim of acquiring a residence permit quickly. However, after the contract period, love and intimacy may have ultimately developed and each party or one party may want the relationship to continue. However, where the migrant has a wife/husband already, then polygamous marriage occurs with all its associated pressure or divorce. There is also the possibility of transferring bad behaviors from the migrant into the host culture. The reverse could also be true. Again, many immigrants lose their ties all together with the country of origin (Participant 8).

Migration also has some positive psychological implications as well. The immigrant learns or acquires knowledge, innovative and creative skills from the host culture which boost his/her ego or sense of worth. There is also the possibility of social learning. Some values such as hard work, discipline, openness may positively impact on the immigrants. When the immigrant is able to socialize properly and gain good job with decent remuneration, the sense of worth and esteem are empowered. Socio-centrism may be carried into the host culture. Thus the host culture may also learn some good things from the lived experience of the immigrants. Formal marriage could be arranged by the immigrant and the indigene. This becomes fruitful when stereotypes and prejudices are ironed out. Better health care facility in the host country may build the personality of the immigrant (Participant 9).

A participant made the narrative below when explaining the causes and implications of migration:

Availibility of natural resources such as fertile land for agriculture, water, green vegetation with food, building sand and timber for wood works, and areas that can facilitate the rearing of livestock tend to attract people to migrate. Examples are river basins (e.g. The River Niger Basin in West Africa); and forested zones (e.g. Cameroon has tended to attract a lot of migrants from her neighbours, such as Equatorial Guinea, Gabon, and Chad) (Participant 9).

Conflicts scare people away from their home regions. In Ghana, for instance, there are migrants from Cote d’evoire, Mali, and Liberia, due to conflicts in their native countries. These conflicts have sprung up from ethnic tensions, conflicting claims over mostly land resources, and chieftaincy claims. Common to life pursuit is the desire to improve one’s living condition. Where one’s native area gives a relatively limited chance of pursuing desired goals, he or she may look elsewhere for better opportunities. Historically, the Fulanis of the Sahel Region (Burkina Faso, Mali, Niger, Mauretania and Chad) have tended to move southward to Ghana, Togo, Benin, Nigeria, and other Southern based nations. The reason is to improve socio-economic conditions and alleviate impoverishment. Migrants have also moved from landlocked countries to coastal based countries for economic opportunities (Participant 8).

When large numbers of people move from one country to the other, it means there is a reduction in population at say location ‘A’ and an increase in population in location ‘B’ (the destination place). This may put pressure on public facilities such as housing, hospitals, schools, electricity, water etc. in the receiving country or country of destination- location B. For the population in location ‘B’, if the majority of the emigrants are within the workforce, the manpower expertise will reduce drastically. This
will affect the country’s production capacity or increased cost of production when additional hands from other countries are recruited for such purpose. Where the immigrants carry their families along, there is a transfer of burden from one location to the other which can negatively affect the host country if it has not adequately prepared for that. Cross border crimes also increase during the migration. There is the tendency of environmental stress resulting from high consumption and waste generation in the receiving country (Participant 6).

On the issue of attainment of citizenship and implications, participants have this to say:
Citizenship is attained by the following ways: when one originates from a given a country (is an indigene), born in a given country, married to an indigene and finally by opting to become a citizen through the process of naturalization. A migrant who has gone through the legal processes of citizenship of the state and has attained it, automatically assumes a new status thereby receiving some privileges such as voting right, ability to hold public office, claim unemployment insurance payment, right to protection under the law and the court system, right to own property, carry out business and practice certain professions among others (interviewer 11).

Another participant puts the following voice:
Privileges go with some responsibilities like payment of taxes, obedience to the law and adherence to societal standards in terms of social and moral behaviours, care for the feelings and rights of others and use of one’s skill to help improve the community. However, the problem is that today, acquiring citizenship by naturalization or by birth in a foreign country has been marked with severe struggle and tension. The process is an herculean task (Interviewer 10).

On the issue of belongingness, it was revealed that Africans are normally well received by the African communities in the receiving country (Europe) but very difficult to be accepted within the European communities. The narrative below expresses it:
The Africans’ sense of belongingness in the European community is minimal. Racial discrimination and inequitable treatment against Africans in Europe continuous and abounds. Africans on the contrary, mostly accept European immigrants. In Ghana for example, they have a very warm reception and are helped to settle. This is however, more often than not determined by individual characteristics and the locality in Africa where the European is settling (Interviewer 11)

It is also evidenced that Europeans adapt and adopt quickly in Africa than African immigrants in Europe. See the narrative below:
The European immigrants in Ghana feel more secured and comfortable than that of the African immigrants in Europe (interviewer 12).

3. Discussions
Shore (2002), defines culture as shared meanings, understanding or referent held by a group of people. When people migrate from one nation to the other, they carry their knowledge, distress and hope with them. On settling down in the new culture, their cultural identity is likely to change. African immigrants in an European culture, whether they have attained citizenship or not, normally get settled down by assimilation; bi-culturation; separation; or by marginalization.

By assimilation, they adopt the receiving country’s culture and discard the heritage culture. As immigrants acquire the values, practices and benefits of their new homeland, they are normally expected to discard those from their cultural heritage. However, others have argued that receiving culture acquisition and heritage retention are cast as independent dimensions (Berry, 1980).

Kivisto (2001) sees transnationalism as a form of assimilation on the basis that immigrants maintain social ties in their countries of origin while engaging in processes of acculturation in the host society. Moreover, he argues that contrary to the transnational view of immigrants simultaneously living in two countries, at any given moment immigrants are located in one, and the immediate concerns of the receiving country take precedence over the more distant concerns of the sending community. However, defining transnationalism as a form of assimilation or adaptation does not take into account the variation of transnational behaviours among immigrants with comparable familiar and social ties in their countries of origin.

Bi-culturation is where immigrants integrate or adopt the receiving culture and concurrently retain the heritage culture (Martinez & Haritatos, 2005). Separation is where migrants reject the receiving country’s culture and retain the heritage culture. Marginalization is the case that a migrant rejects both the heritage culture and the receiving country’s culture (Berry, 2006). Migrants who are discriminated against in the host culture may have more trouble adapting (Portes, 2006) and resist practices, values and identification with the host culture.
(Rumbant, 2008). There are also cross cultural tensions within ethnically mixed family and between family and its culturally different environment due to the geographic moves. Culturally, homeless individual may enjoy a broader stronger cognitive and social repertoire because of their multicultural frame of reference (Narrarette, 1999).

Language is part of national identity. Migrants who speak other languages or cannot speak the language of the country they are settling are considered a threat to national unity. Permutation among language-ethnicity and cultural similarity and other factors affect the ease or difficulty associated with the cultural process. Inability to speak the receiving country’s accent gives the immigrant out and may cause discrimination and scorn from the native people (Yoo, Gee & Takeuchi, 2009). Others may perceive the inability to learn the receiving countries language as a sign of disrespect which carries bad implications. Incidence of trafficking, exploitation and abuse of migrants abound in other parts of Africa as both legal and illegal migration have become commercialized (Show, 2007). A study confirms that maternal migrants might dictate that remittances are spent on children’s education leading to possible domestic tensions (Rossi, 2008).

Black (2001), maintains that environment crisis is typically linked to mass population movement which sometimes is seen as antithesis to development. It also involves more administrative expenses, difficulty in getting job, accessing state services and learning a new language (Weeks, 1999).

Geographical mobility is widely recognized as one of the main facilitating conditions of HIV transmission in Sub-Saharan Africa (Winter, 1999).

Labour markets job openings, unemployment, incomes, trade, competition as well as import and export patterns are all impacted by migration. Highly skilled immigrants have been noted for helping eliminate labour shortages in certain industries in Europe. Economic growth that is GDP was almost 6% higher in Germany than without migrants. 9000 jobs were created and that migration created a surplus of DM14 billion in the public sectors compared to the baseline in Germany.

Also, nations in Africa receive significant share of their foreign exchange from remittances which is stable and predictable (Ratha, 2003). Migrants from Africa send higher remittances to their relatives and that serve as a counter cyclical instruments during negative shock. For instance in the last decade remittances have emerged as the second largest source of funding for developing countries and their volumes continue to grow. According to the World Bank, in 2005, migrants worldwide sent a total of $232 billion in remittances. Of these, an estimated $167 billion dollars was sent to countries in the developing world- more than twice that of official development aid and ten times the net private capital transfers (World Bank 2006; Kapur & McHale 2003; Rossi, 2008)

Possibility of transfer of skills acquired over the years by return migrants creates a significant impact on the economies of most African countries. Migrants from Africa are a reservoir of great potential that can be harnessed and unleashed to transform the development prospects of many countries and assist in the fight against poverty, hunger, disease and human suffering (Ratha et al, 2008). Immigrants who work as doctors, engineers or other professionals are received with open arms in Europe whereas refugees and asylum seekers as well as immigrants from low socio-economic brackets and those who migrate illegally may be viewed as a drain on the receiving country’s resources (Stoner, 2009) and may more likely face discrimination (Louis, Duck, Terry, Schuller and Loland, 2007). Countries like Poland and Romania flock to central Europe to offer labour.

As the least accepted immigrant group, the integration of African immigrants into for instance Spanish society conforms to the differential exclusion model. In this model, immigrants are incorporated as ethnic minorities marginalized by both their ethnicity and immigrant status (Castles 1995; King and Rodríguez-Melguizo 1999).

African immigrants are incorporated into specific sectors, such as the labor market, but are denied access to social services. This means that African immigrants in Europe who have much talent, skills and education like doctors, engineers, architects have relatively better treatment.

African crises have direct and decision making impact on the European migration and foreign policy. European national governments seek to protect their own indigenous labour forces from rapidly rising unemployment by restricting migration and sometimes returning migrants to their country of origin. It also pays special attention to the current poverty and conflict driven African migration toward Europe by putting long term measures to secure itself outside of its territory that prevent the flow of immigration from African crisis region. For instance, Europe sent its intervention troops to Democratic Republic of Congo in 2006 as part of its migration policy to protect itself from spillover effects of the African crises.

On a more serious note, the 9/11 terrorists attack in New York and bombing of Madrid in March 2004 and London in July, 2005 have prompted Europe to tighten its security not only internally but also externally. It has also informed the West to take a second look at its international relations policy. The growing number of migrants from Africa and other parts of the world to Europe is considered as one of the key threats to European
political and social security. Implicitly and explicitly, African migrants are being considered in Europe as Islamic fundamentalists, potential terrorists, drug dealers and criminals, thus the increased resentments against legal and illegal migrants and securitization of migration. Great Britain, France, Italy and Germany formed alliance to collectively fight illegal migration and terrorism from Africa and also planned to create reception for African refugees in Northern African states.

As part of the securitization measures, raider systems, day and night vision cameras, tear gas diffusion and detection wires are used. Spain has also doubled the height of the fences that separate the enclave from Morocco. This means, 'fortress building of Europe'. This is aimed at reducing immigration.

Portes and Zhou (1993) have identified three features of the receiving environment that contribute to downward mobility as: discrimination, residence in impoverished areas, and restricted economic opportunities.

This is aimed at reducing immigration.

It was revealed that as Western economies kept growing, it was more likely labour migration to Europe would continue to persist or increase if effective policies and structures were not put in place. Conversely, very significant developments in Africa will reduce migration to Europe and rather would attract foreign immigrants into Africa whose skills and knowledge will help contribute to the socio-economic developments of Africa. On the more serious note since Africans’ migration to Europe and other parts of the world is for security and conflict free environment, it is suggested that African leaders must not be mere power seeking and amassing of wealth but rather show love for the people they seek their endorsement into power by creating conflict and violence free environment for them. This will cause the majority to stay at the home country. African governments are to ensure that their available resources are prudently used and should explore avenues that could speed up their socio-economic, political and technological developments. Job creation, investment in education, agriculture, and the manufacturing sectors through foreign partnership will definitely open up the economy of Africa. Foreign investors that will be attracted will contribute significantly to Africa’s development. General development in Africa will more likely curb migration from Africa.

Besides, African governments have to seriously control illegal emigration from their continent and ensure that legal and crises forced immigrants from Africa in Europe have their fundamental human rights and dignity protected. For example, African asylum seekers, refugees and other labour migrants from Africa to Europe must have their human rights protected. There should also be a support system for them mooted by both the host and the home nations. This is possible through international relations agreements, mutual calibrations and negotiations.

Furthermore, the European protectionist and restricted trade policies must be regulated and the process by which immigrants send remittances home should be made simple and secured. Besides, the fortress building of Europe has led to greater reliance on increasingly risky and costly undocumented migration which have paradoxically encouraged permanent settlement, professionalization of people smuggling, partial criminalization of migration, increasing financial and human cost and risk of border crossing and interrupting patterns of circular migration (de Haas, 2005, Massey, 2005; Harvis, 2002). Hein de Haas (research officer at IMI, university of Oxford)

It is important to intensify dialogue in terms of building relationships, caring and treating everyone with sensitivity irrespective of colour or race or tribe. Human right values, equality, justice, rule of law must be valued and respected.

Future research may cover other areas such Africa migration to North America, Caribbean, Australian and Asia.

CALL FOR JOURNAL PAPERS

The IISTE is currently hosting more than 30 peer-reviewed academic journals and collaborating with academic institutions around the world. There’s no deadline for submission. **Prospective authors of IISTE journals can find the submission instruction on the following page:** http://www.iiste.org/journals/ The IISTE editorial team promises to the review and publish all the qualified submissions in a fast manner. All the journals articles are available online to the readers all over the world without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself. Printed version of the journals is also available upon request of readers and authors.
