Abstract
In the Present paper we prove some fixed point theorems in cone metric space our result generalizes the previous result of mathematicians.

Keywords:- fixed point cone, metric space, Altering function.

2. Introduction & Preliminaries
Since the Banach contraction Principles several types of generalization contraction mapping on metric spaces have appeared, one such method of generalization is altering the distances. Delbosco [2] and skof [3] have established fixed point theorems for self maps of complete metric spaces by altering the distances between the points with the use of a positive real valued function Hunage and zhag [1] introduction the concept of cone metric space by replacing the set of real numbers by an ordered Banach space and obtained some fixed point results. Recently Asadi and Soleimani [7] prove some fixed point results on cone metric space by using altering distance function and the (ID) property of partially ordered cone metric space (see[7]). We are giving some new results by introducing a vector valued function in cone metric space which has similarity with altering function it becomes the generalization of altering function in view of cone used in place of positive read numbers as well as the constraints used for self map of cone metric spaces.

Definition-: Let (X,d) be a cone metric space a self mapping T on x is called an almost jaggi contraction if it satisfies the following condition.

\[ d(Tx,Ty) \leq \alpha \left( \frac{d(x,Tx)d(y,Ty)}{d(x,y)} \right) + \beta \cdot d(x,y) \]

Theorem 3.1 Let (X,d) be a complete cone metric space and p a normal cone with normal constant M, Let \( T: X \to X \) be on almost jaggi contraction for all \( x, y \in X \) where \( L, j \geq 0 \) and \( \alpha, \beta, \gamma \in [0,1] \) with \( \alpha + \beta + \gamma > 1 \) then T has a unique fixed point in X.

Proof:- choose \( x_0 \in X \) set \( x_1 = T x_0 \), \( x_n = T x_{n-1} \)

\[ d(x_n, x_{n+1}) = d(Tx_n, Tx_{n+1}) \leq \frac{\alpha \cdot d(x_{n-1} ,Tx_{n-1}) \cdot d(x_n, Tx_n)}{d(x_{n-1}, x_n)} + \beta \cdot d(x_{n-1} ,x_n) \]

\[ + \gamma \left( \frac{d(x_{n-1} ,Tx_{n-1}) + d(x_n, Tx_{n-1}) + d(x_{n-1} ,Tx_{n-1}) + d(x_n, Tx_{n-1})}{1 + d(x_{n-1} ,Tx_{n-1}) \cdot d(x_n, Tx_{n-1}) \cdot d(x_{n-1} ,Tx_{n-1})} \right) \]

\[ + L \cdot \min \{ d(x_n, Tx_n), d(x_{n+1}, Tx_{n+1}) \} \]

For all \( x, y \in X \) where \( L, j \geq 0 \) and \( \alpha, \beta, \gamma \in [0,1] \) with \( \alpha + \beta + \gamma > 1 \) then T has a unique fixed point in X.
+J Min \{d(x_{n-1}, x_{n+1}), d(x_{n-1}, T x_{n})\}
\begin{align*}
&\frac{d(x_{n-1}, x_n) d(x_{n-1}, x_{n+1})}{d(x_{n-1}, x_n)} + \beta \ d(x_{n-1}, x_n) \\
&\gamma \left[ d(x_{n-1}, x_{n+1}) + d(x_{n-1}, x_n) + d(x_{n-1}, x_{n+1}) \right] \\

&+ J \ Min \{d(x_{n-1}, x_{n+1}), d(x_{n-1}, x_n)\}
\end{align*}
\begin{align*}
&d(x_{n}, x_{n+1}) \leq \alpha \ d(x_{n}, x_{n+1}) + \beta \ d(x_{n-1}, x_{n}) \\
&+ \gamma \left[ d(x_{n-1}, x_{n+1}) + d(x_{n-1}, x_n) + d(x_{n-1}, x_{n+1}) \right] \\
&+ J \ Min \{d(x_{n-1}, x_{n+1}), d(x_{n-1}, x_n)\}
\end{align*}
\begin{align*}
&d(x_{n}, x_{n+1}) \leq \alpha \ d(x_{n}, x_{n+1}) + \beta \ d(x_{n-1}, x_{n}) \\
&+ \gamma \left[ d(x_{n-1}, x_{n+1}) + d(x_{n-1}, x_n) + d(x_{n-1}, x_{n+1}) \right] \\
&+ J \ Min \{d(x_{n-1}, x_{n+1}), d(x_{n-1}, x_n)\}
\end{align*}
\begin{align*}
&d(x_{n}, x_{n+1}) \leq \alpha \ d(x_{n}, x_{n+1}) + \beta \ d(x_{n-1}, x_{n}) \\
&+ \gamma \left[ d(x_{n-1}, x_{n+1}) + d(x_{n-1}, x_n) + d(x_{n-1}, x_{n+1}) \right] \\
&+ J \ Min \{d(x_{n-1}, x_{n+1}), d(x_{n-1}, x_n)\}
\end{align*}
\begin{align*}
&d(x_{n}, x_{n+1}) \leq \alpha \ d(x_{n}, x_{n+1}) + \beta \ d(x_{n-1}, x_{n}) \\
&+ \gamma \left[ d(x_{n-1}, x_{n+1}) + d(x_{n-1}, x_n) + d(x_{n-1}, x_{n+1}) \right] \\
&+ J \ Min \{d(x_{n-1}, x_{n+1}), d(x_{n-1}, x_n)\}
\end{align*}
\begin{align*}
&d(x_{n}, x_{n+1}) \leq \alpha \ d(x_{n}, x_{n+1}) + \beta \ d(x_{n-1}, x_{n}) \\
&+ \gamma \left[ d(x_{n-1}, x_{n+1}) + d(x_{n-1}, x_n) + d(x_{n-1}, x_{n+1}) \right] \\
&+ J \ Min \{d(x_{n-1}, x_{n+1}), d(x_{n-1}, x_n)\}
\end{align*}

Case I

= J \ d(x_{n-1}, x_{n}) \text{ Then}
\begin{align*}
(1 - \alpha - 2\gamma) \ d(x_{n}, x_{n+1}) \leq (\beta + 2\gamma + J) \ d(x_{n-1}, x_n) \\
\end{align*}
\begin{align*}
&d(x_{n}, x_{n+1}) \leq \frac{(\beta + 2\gamma + J)}{(1 - \alpha - 2\gamma)} \ d(x_{n-1}, x_n)
\end{align*}
\begin{align*}
&R_1 = \frac{(\beta + 2\gamma + J)}{1 - \alpha - 2\gamma} , \alpha + \beta + 4\gamma + J < 1
\end{align*}
\begin{align*}
&d(x_{n}, x_{n+1}) \leq R_1 (x_{n-1}, x_n)
\end{align*}

Case II

= d(x_{n-1}, x_{n}) \text{ Then}
\begin{align*}
&d(x_{n}, x_{n+1}) (1 - \alpha - 2\gamma) \leq (\beta + 2\gamma) \ d(x_{n-1}, x_n) + Jd (x_n, x_{n+1}) \\
&d(x_{n}, x_{n+1}) (1 - \alpha - 2\gamma) \leq (\beta + 2\gamma) d (x_{n-1}, x_n) \\
&d(x_{n}, x_{n+1}) \leq \frac{(\beta + 2\gamma)}{(1 - \alpha - 2\gamma)} \ d(x_{n-1}, x_n)
\end{align*}
\begin{align*}
&R_2 = \frac{(\beta + 2\gamma)}{(1 - \alpha - 2\gamma)} , \alpha + \beta + 4\gamma + J < 1.
\end{align*}

We get Then both case, \( R = R_1 = R_2 = \alpha + \beta + J + 4\gamma < 1 \)
and by induction, \( d(x_{n}, x_{n+1}) \leq R \ d(x_{n-1}, x_n) \)
\begin{align*}
&\leq R^n \ d(x_0, x_1) \\
&d(x_{n}, x_{m}) \leq d(x_{n}, x_{n+1}) + d (x_{n+1}, x_{n+2}) + \ldots + d(x_{n+m-1}, x_{m}) \\
&\leq (R^n, R^{n+1} + \ldots + R^{n+m-1})d(x_0, x_1) \\
\end{align*}
\[ d(x_n, x_m) \leq \frac{R^n}{1 - R} d(x_0, x_1). \]

We get \( d(x_n, x_m) \leq M^{\frac{R^n}{1 - R}} H(x_0, x_1) H \) which implies that \( d(x_n, x_m) \to 0 \) as \( n \to \infty \) hence \( x_n \) is a Cauchy sequence so by completeness of \( X \) this sequence must be convergent in \( X \)

\[ d(u, Tu) \leq d(u, x_{n+1}) + d(x_{n+1}, Tu) \]
\[ \leq d(u, x_{n+1}) + d(Tx_n, Tu) \]
\[ \leq d(u, x_{n+1}) + \frac{\alpha}{d(x_n, u)} [d(Tx_n, Tu) + d(u, Tx_n) + d(x_n, Tx_n) + d(u, Tu)] \]
\[ + \frac{\beta}{d(x_n, u)} d(x_n, u) \]
\[ + L \min \{d(x_n, u), d(u, Tx_n)\} \]
\[ + J \min \{d(x_n, Tu), d(u, Tu)\} \]
\[ \leq d(u, x_{n+1}) + \frac{\alpha}{d(x_n, u)} d(u, u) + \frac{\beta}{d(x_n, u)} d(x_n, u) \]
\[ + \frac{\gamma}{1 + d(x_n, x_{n+1})} [d(u, x_n) + d(x_n, x_{n+1}) + d(u, u)] \]
\[ + L \min \{d(x_n, u), d(u, u)\} \]
\[ + J \min \{d(x_n, u), d(u, u)\} \]
\[ \leq d(u, x_{n+1}) + \beta d(x_n, u) + \frac{\gamma}{1 + d(x_n, x_{n+1})} [d(u, x_n) + d(x_n, x_{n+1}) + d(u, u)] \]
\[ + L \min \{d(x_n, u), d(u, u)\} \]
\[ \leq d(u, x_{n+1}) + \beta d(x_n, u) + 2\gamma [d(u, x_{n+1})] \]
\[ + L \min \{d(x_n, u), d(u, u)\} \]
\[ \leq d(u, x_{n+1}) + \beta d(x_n, u) + 2\gamma [d(x_n, u) + d(u, u)] \]
\[ + L \min \{d(x_n, u), d(u, u)\} \]
\[ \leq (1 + 2\gamma) d(u, x_{n+1}) + (\beta + 2\gamma) d(x_n, u) \]
\[ + L \min \{d(x_n, u), d(u, u)\} \]

So using the condition of normality of cone

\[ II d(u, Tu) II \leq M(1 + 2\gamma) II d(u, x_{n+1}) II + (\beta + 2\gamma) II d(x_n, u) II \]
\[ + L \min \{d(x_n, u), d(u, u)\} II \]

As \( n \to 0 \) we have \( II d(u, Tu) II \to 0 \) hence we get

\[ u = Tu. \text{ u is a fixed point} \]

**Theorem (3.2)** Let \((X, d)\) be a complete cone metric space and \( P \) a normal cone with normal constant \( M \), suppose the mapping \( F, G \), is called on almost jaggi contraction if it satisfies the following condition

\[ d(Fx, Gy) \leq \alpha \frac{d(x, Fx) + d(y, Gy)}{d(x, y)} + \beta \frac{d(x, y)}{d(x, y)} \]
\[ + \gamma \frac{[d(x, Gy) + d(y, Fx) + d(x, Fx) + d(y, Gy)]}{1 + d(x, Fx), d(y, Gy), d(Fy, Fx), d(x, Gy) + d(x, Gy)} \]
\[ + L \min \{d(x, Gy), d(y, Fx)\} \]
\[ + J \min \{d(x, Fx), d(y, Gy)\} \]
For all \( x, y \in X \) where \( l \geq 0 \) and \( \alpha, \beta, \gamma \in (0, 1) \) with \( \alpha + \beta + \gamma < 1 \) then each of \( F, G \) has a unique fixed point and these two fixed points coincide.

**Proof:** Let \( x \in F(x_0) \) and \( x_2 = G(x_1) \) such that

\[
\begin{align*}
\nu_{2n+1} &= F(x_{2n}), \\
\nu_{2n+2} &= G(x_{2n+1}), \\
\nu_{2n} &= \nu_{2n+1} \quad \text{such that} \\
L \min d(x_{2n}, x_{2n+1}) &= \nu_{2n+1} - \nu_{2n}.
\end{align*}
\]

\[
\begin{align*}
&d(x_{2n}, x_{2n+1}) = d(F(x_{2n}), G(x_{2n+1})) \\
&\leq \alpha d(x_{2n}, x_{2n+1}) + \beta d(x_{2n}, x_{2n+2}) \\
&+ \gamma d(x_{2n}, x_{2n+2}) + d(x_{2n+1}, x_{2n+2}) + d(x_{2n+2}, x_{2n+1}) \\
&+ L \min d(x_{2n}, x_{2n+1})d(x_{2n+1}, x_{2n+2}) \\
&+ J \min d(x_{2n}, x_{2n+2})d(x_{2n+1}, x_{2n+1}).
\end{align*}
\]

Case I. When \( L \min d(x_{2n}, x_{2n+1}), d(x_{2n+1}, x_{2n+2}) = d(x_{2n}, x_{2n+1}) \)

Then

\[
\begin{align*}
d(x_{2n+1}, x_{2n+2}) &\leq \alpha \cdot d(x_{2n+1}, x_{2n+2}) + \beta \cdot d(x_{2n+1}, x_{2n+2}) \\
&+ 2\gamma d(x_{2n+1}, x_{2n+2}) + J d(x_{2n+1}, x_{2n+1}) \\
(1 - \alpha - 2\gamma) d(x_{2n+1}, x_{2n+2}) &\leq (\beta + J + 2\gamma) d(x_{2n}, x_{2n+1}) \\
d(x_{2n+3}, x_{2n+2}) &\leq \frac{(\beta + J + 2\gamma)}{1 - \alpha - 2\gamma} d(x_{2n}, x_{2n+1})
\end{align*}
\]

where \( R_1 = \frac{(\beta + J + 2\gamma)}{1 - \alpha - 2\gamma}, \alpha + \beta + J + 4\gamma < 1 \)

\[
d(x_{2n+1}, x_{2n+2}) \leq R_1 d(x_{2n}, x_{2n+1})
\]

Case II. When \( \min d(x_{2n}, x_{2n+1}), d(x_{2n+1}, x_{2n+2}) = d(x_{2n+1}, x_{2n+2}) \)

\[
\begin{align*}
d(x_{2n+1}, x_{2n+2}) &\leq \alpha \cdot d(x_{2n+1}, x_{2n+2}) + \beta \cdot d(x_{2n+1}, x_{2n+2}) \\
&+ 2\gamma d(x_{2n+1}, x_{2n+2}) + J d(x_{2n+1}, x_{2n+1}) \\
(1 - \alpha - 2\gamma) d(x_{2n+1}, x_{2n+2}) &\leq (\beta + J + 2\gamma) d(x_{2n}, x_{2n+1}) \\
d(x_{2n+3}, x_{2n+2}) &\leq \frac{(\beta + J + 2\gamma)}{1 - \alpha - 2\gamma} d(x_{2n}, x_{2n+1})
\end{align*}
\]
\[ d(x_{2n+1}, x_{2n+2}) \leq \frac{\beta + 2\gamma}{(1 - \alpha - J - 2\gamma)} d(x_{2n}, x_{2n+1}) \]

Where \( R_2 = \frac{\beta + 2\gamma}{(1 - \alpha - J - 2\gamma)}, \alpha + \beta + J + 4\gamma < 1 \)

In both case we get \( R_1 = R_2 = R \).

Then \( d(x_{2n+1}, x_{2n+2}) \leq R \cdot d(x_{2n}, x_{2n+1}) \)

\[ d(x_{2n+1}, x_{2n+2}) = d(Fx_{2n+1}, Gx_{2n+1}) \]

\[ \leq \alpha \left( \frac{d(x_{2n+2}, Fx_{2n+2})d(x_{2n+1}, Gx_{2n+1})}{d(x_{2n+2}, x_{2n+1})} \right) \beta \cdot d(x_{2n+2}, x_{2n+1}) \]

\[ + L \min\{d(x_{2n+2}, Gx_{2n+1}), d(x_{2n+1}, Fx_{2n+2})\} \]

\[ + J \min\{d(x_{2n+1}, Fx_{2n+2}), d(x_{2n+2}, Gx_{2n+1})\} \]

\[ \leq \alpha \left( \frac{d(x_{2n+2}, x_{2n+3})d(x_{2n+1}, x_{2n+2})}{d(x_{2n+2}, x_{2n+3})} \right) + \beta \cdot d(x_{2n+2}, x_{2n+1}) \]

\[ + J \min\{d(x_{2n+2}, Gx_{2n+1}), d(x_{2n+1}, Fx_{2n+2})\} \]

Case-I when \( \min\{d(x_{2n+3}, x_{2n+2}), d(x_{2n+1}, x_{2n+2})\} = d(x_{2n+1}, x_{2n+2}) \)

Then \( d(x_{2n+1}, x_{2n+2}) \leq \alpha \cdot d(x_{2n+3}, x_{2n+2}) + \beta \cdot d(x_{2n+2}, x_{2n+1}) \]

\[ + 2\gamma \left( d(x_{2n+1}, x_{2n+2}) \right) \]

\[ + J \cdot d(x_{2n+1}, x_{2n+2}) \]

\[ (1 - \alpha - 2\gamma) d(x_{2n+3}, x_{2n+2}) \leq (\beta + J + 2\gamma) d(x_{2n+2}, x_{2n+1}) \]

\[ d(x_{2n+3}, x_{2n+2}) \leq \frac{(\beta + J + 2\gamma)}{(1 - \alpha - 2\gamma)} d(x_{2n+2}, x_{2n+1}) \]
where \( R_1 = \frac{(\beta + J + 2\gamma)}{(1 - \alpha - 2\gamma)}, \alpha + \beta + J + 4\gamma < 1 \)

\[ d(x_{2n+3}, x_{2n+2}) \leq R_1 d(x_{2n+1}, x_{2n+1}) \]

**Case II** – when \( \min\{d(x_{2n+3}, x_{2n+2}), d(x_{2n+2}, x_{2n+1})\} = d(x_{2n+2}, x_{2n+1}) \)

\[ d(x_{2n+3}, x_{2n+2}) \leq \alpha d(x_{2n+3}, x_{2n+2}) + \beta d(x_{2n+2}, x_{2n+1}) + 2\gamma d(x_{2n+3}, x_{2n+2}) + d(x_{2n+2}, x_{2n+1}) \]

\[ + J d(x_{2n+2}, x_{2n+1}) \]

\[ (1 - \alpha - J - 2\gamma) d(x_{2n+3}, x_{2n+2}) \leq (\beta + 2\gamma) d(x_{2n+2}, x_{2n+1}) \]

\[ d(x_{2n+3}, x_{2n+2}) \leq \frac{(\beta + 2\gamma)}{(1 - \alpha - J - 2\gamma)} d(x_{2n+2}, x_{2n+1}) \]

where \( R_2 = \frac{(\beta + 2\gamma)}{(1 - \alpha - J - 2\gamma)}, \alpha + \beta + J + 4\gamma < 1 \), Then

\[ d(x_{2n+3}, x_{2n+2}) \leq R_2 d(x_{2n+2}, x_{2n+1}) \]

In both case we get \( R_1 = R_2 = R \).

(B) \[ d(x_{2n+3}, x_{2n+2}) \leq Rd(x_{2n+2}, x_{2n+1}) \]

Add Equation (A) and (B) we get

\[ \sum_{n=1}^{\infty} d(x_n, x_{n+1}) \leq \sum_{n=1}^{\infty} R^n d(x_0, x_1) \]

\[ = \frac{R}{1 - R} d(x_0, x_1) \]

We get \( \| d(x_n, x_{n+1}) \| \leq M \frac{R}{1 - R} \| d(x_0, x_1) \| \) which implies that

\( d(x_n, x_{n+1}) \rightarrow 0 \) as \( n \rightarrow \infty \)

Hence \( \{x_n\} \) is a Cauchy sequence, so by completeness of \( X \) this sequence must be convergent in \( X \), we shall prove that \( u \) is a common fixed of \( F \) and \( G \).

\[ d(u, Gu) \leq d(x_{2n+1}, Gu) \]

\[ \leq d(u, x_{2n+1}) + d(Fx_{2n}, Gu) \]

\[ \leq d(u, x_{2n+1}) + \frac{[\alpha d(x_{2n}, x_{2n+2}), d(u, Gu)]}{d(x_{2n}, u)} + \beta(x_{2n}, u) \]

\[ + \gamma d(x_{2n}, x_{2n+1}) + d(u, x_{2n+1}) + d(x_{2n}, x_{2n+1}) + d(u, Gu) \]

\[ \frac{[1 + d(u, x_{2n+1}), d(u, Gu), d(x_{2n}, Gu), d(u, Fx_{2n})]}{+ \lambda \min\{d(x_{2n}, Gu), d(u, Fx_{2n})\} + \lambda \min\{d(x_{2n}, Fx_{2n}), d(u, Gu)\}} \]

\[ + J \min\{d(x_{2n}, x_{2n+1}), d(x_{2n+1}) \} \]

\[ \leq d(u, x_{2n+1}) + \frac{\alpha}{d(x_{2n}, u)} + \beta(x_{2n}, u) \]

\[ + \gamma d(x_{2n}, x_{2n+1}) + d(u, x_{2n+1}) + d(x_{2n}, x_{2n+1}) + d(u, x_{2n+1}) \]

\[ \frac{1 + d(u, x_{2n+1}), d(u, x_{2n+1}), d(x_{2n}, u), d(x_{2n+1}, u)}{+ \lambda \min\{d(x_{2n}, u), d(u, x_{2n+1})\} + \lambda \min\{d(x_{2n}, x_{2n+1}), d(u, u)\}} \]

\[ \leq d(u, x_{2n+1}) + \beta(x_{2n}, u) + \gamma d(x_{2n}, u) + d(u, x_{2n+1}) + d(x_{2n}, x_{2n+1}) \]

\[ + \lambda \min\{d(x_{2n}, u), d(u, x_{2n+1})\} \]
So using the condition of normality of cone

\[ \| d(u,Gu) \| \leq M(\| d(u,x_{2n+1}) \| + \beta \| d(x_{2n},u) \| + 2\gamma [\| d(x_{2n},u) \| + d(u,x_{2n+1}) \|] + L \min \{ d(x_{2n},u), d(u,x_{2n+1}) \} \]

As \( n \to 0 \) we have \( \| d(u,Gu) \| \leq 0 \); hence we get \( u = Gu \)

U is a fixed point of G.

Similarly

\[ d(u,Fu) \leq d(u,x_{2n+2}) + d(x_{2n+2},Fu) \]

\[ \leq d(u,x_{2n+2}) + d(Fu,Gx_{2n+1}) \]

\[ \leq d(u,x_{2n+2}) + \frac{[\alpha \cdot d(u,Fu), d(x_{2n+1},Gx_{2n+1})]}{d(u,x_{2n+1})} + \beta \cdot d(u,x_{2n+1}) \]

\[ + \gamma [d(u,Gx_{2n+1}) + d(x_{2n+1},Fu)] + d(u,Fu), d(x_{2n+1},Gx_{2n+1}) + d(u,Fu), d(x_{2n+1},Fu) \]

\[ + L \min \{ d(u,Gx_{2n+1}), d(x_{2n+1},Fu) \} \]

\[ + J \min \{ d(u,Fu), d(x_{2n+1},Fu) \} \]

\[ \leq d(u,x_{2n+2}) + \frac{[\alpha \cdot d(u,Fu), d(x_{2n+1},x_{2n+2})]}{d(u,x_{2n+1})} + \beta \cdot d(u,x_{2n+1}) \]

\[ + \gamma [d(u,x_{2n+2}) + d(x_{2n+1},u) + d(u,u) + d(x_{2n+1},x_{2n+2})] \]

\[ + L \min \{ d(u,x_{2n+1}), d(x_{2n+1},u) \} \]

\[ + J \min \{ d(u,Fu), d(x_{2n+1},u) \} \]

\[ \leq M(\| d(u,x_{2n+1}) \| + \beta \| d(u,x_{2n+1}) \| + 2\gamma [\| d(u,x_{2n+1}) \| + d(u,x_{2n+1}) \|] + L \min \{ d(u,x_{2n+1}), d(u,x_{2n+1}) \} \]

So using the condition of normality of cone

\[ \leq M(\| d(u,x_{2n+1}) \| + \beta \| d(u,x_{2n+1}) \| + 2\gamma [\| d(u,x_{2n+1}) \| + d(u,x_{2n+1}) \|] + L \min \{ d(u,x_{2n+1}) \| d(u,x_{2n+1}) \| \}

As \( n \to 0 \) we have \( \| d(u,Fu) \| \leq 0 \); hence we get

\( u = Fu \); u is a fixed point of F.
REFERENCES

The IISTE is a pioneer in the Open-Access hosting service and academic event management. The aim of the firm is Accelerating Global Knowledge Sharing.

More information about the firm can be found on the homepage: http://www.iiste.org

CALL FOR JOURNAL PAPERS

There are more than 30 peer-reviewed academic journals hosted under the hosting platform.

Prospective authors of journals can find the submission instruction on the following page: http://www.iiste.org/journals/ All the journals articles are available online to the readers all over the world without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself. Paper version of the journals is also available upon request of readers and authors.
